

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

#### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + Refrain from automated querying Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

#### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at http://books.google.com/

## CENSUS OF IRELAND FOR THE YEAR 1861.

## REPORT AND TABLES UPON VITAL STATISTICS.

HIS EXCELLENCY GEORGE WILLIAM FREDERICK, EARL OF CARLISLE, K.G.,

LORD LIEUTENANT GENERAL AND GENERAL GOVERNOR OF IRELAND, &c., &c., &c.

#### THE STATUS OF DISEASE.

MAY IT PLEASE YOUR EXCELLENCY,

WE the Commissioners appointed under the provisions of the Act 23 and Introduc-24 Victoria, cap. 62, to take an account of the population of Ireland for the year 1861, tory Obser-

beg to submit the following Report upon the subject of Vital Statistics.

The first part consists of the examination of the returns made to us of the permanent and temporary diseases under which the population of Ireland laboured on the night of the 7th of April, 1861, and includes the consideration of the Deaf and Dumb, the Blind, the Lunatic and Idiotic, the Lame and Decrepit; and the Sick, either in Workhouses, Hospitals, Prisons, or Asylums—as comprised in the "Report on the Status of Disease," published for 1851. The second portion contains the Report and Tables upon the Returns of Deaths, which in lieu of a General Registration of Deaths in this country have been afforded by the Census forms for the decennial period\* ending on the 7th of April, 1861, and is analogous to similar Reports made in 1841 and 1851. Both these subjects having been examined and reported upon at considerable length in the Census volumes for 1851, we do not consider it necessary to offer any detailed preliminary observations thereon upon the present occasion.

REPORT UPON THE NUMBER AND CONDITION OF THE DEAF AND DUMB IN IRELAND.

Until the inquiry instituted under the Census Commission for 1851, no trustworthy General Returns had been made as to the number and condition of the Deaf and Dumb in AND DUMB. the British Isles. The information respecting this class of the community published in the Irish Census Reports for 1851, was, we have reason to believe, the most accurate and minute which had at that time been presented to the public in any country in Europe. Following up the inquiry as to the Deaf and Dumb, first instituted in 1851, we repeated Primary the query on this subject on the Form A, or Family Schedule; and in answer thereto inquiry into were made acquainted with the name, age, sex, occupation, and locality of every person believed to be so affected in Ireland upon the 7th of April, 1861, amounting to 12,195, Deaf and Dumb.

of whom 6,238 were males, and 5,957 females.

All the circumstances relating to these parties were then registered in books prepared for the purpose, and a new set of special queries was issued to the Constabulary and Police Enumerators for each person so returned. In these documents we inquired whether the person was born Deaf-and-Dumb, or became so afterwards; to what cause the malady was attributed; whether the persons so returned were paralytic, idiotic, or in any other way mentally or physically affected; whether other members of the family, either of the present or previous generation, had been mute; and also as to the education, social condition, and other circumstances of all the persons so returned. Had these minute inquiries been made upon the original Householders' Schedules, or directly through the Police at the time of taking the Census, the returns thereto might, by imposing too heavy duties upon those who filled or collected the forms, have been either defective, or have interfered with the accuracy of the general enumeration.

The Census of 1851 was taken on the 30th March, and that of 1861 on the 7th April, the intermediate period being 10 years and 8 days.

THE DRAF

Some misconception must have arisen with respect to the meaning to be attached to the AND DUMB. term "Deaf-and-Dumb," for great numbers were returned under that head who proved, on further inquiry, to be Deaf only. Upon instituting the second or special inquiry, however, these latter were sifted out and separated from the total originally returned, and the numbers were finally arranged under the following heads:—Deaf-and-Dumb, and Dumb only, either congenital or acquired, 5,653; Deaf only, or returned in error in the column for Deaf and Dumb in the A. Forms, 6,542.

Comparison with returns of 1851.

Compared with the analogous Returns for 1851, it is remarkable that on that occasion the number returned erroneously as deaf only was but 500. We can attribute this error in the original returns on the present occasion to no other cause than a misconception upon the part of the heads of families or Police enumerators, who mistook Deaf-and-Dumb for Deaf or Dumb. We now beg to present similar Tables to those afforded in 1851; the comparison with which, we confidently trust, will prove of much value, not only to the

TABLE I .- Showing the Number of the Deaf and Dumb from all causes,

<sup>\*</sup> The Suburban District of Dublin comprises the townlands of Clontarf East and West, and Greenlanes, in the parish of Clontarf; Ballybough, and South, in the parish of Grangegorman: Killester South, in the parish of Killester; and part of the parish of St. George's, all situated in the barony of St. Peter, and Taney, in the barony of Dublin; the townlands of Tonguefield and Sallymount, in the parishes of Crumlin and Donnybrook, and barony townlands of Rathgar and Terenure, in the parish of Rathfarnham, and barony of Rathdown. For the details see General Abertands of the Canast of

THE DEAL AND DUMB:

statistician, but also to all those interested in the welfare of this afflicted class of the com-

The only alterations now made are those with respect to the ages—which are given in quinquennial periods, from under 5 to 90—and the occupations both of Deaf Mutes and their parents, which are not given alphabetically, as in the previous Census, but according to a classification based on that employed in arranging the occupations of the people at large.

The additional Tables given on the present occasion are those relating to Religion-Additional an element introduced into the present Irish Census by clause 3 of the Act already Tables. referred to, and which has been carried out through all classes and sections of the community reported upon in that portion of this volume devoted to the consideration of the Status of Disease, and those showing the Occupations, Education, and Marriage State of the Inmates of Public Institutions.

in the several Provinces, Counties, Cities, and certain large Towns, in Ireland.

THE DEAP AND DUMB.

Death and Emigration among Deaf Mutes. Upon the former occasion the secondary inquiry was not instituted for twelve months after the general enumeration was made on the 30th of March, 1851, and during that intervening period 43 Deaf Mutes had emigrated and 139 had died. Upon the present occasion, however, the special queries into the condition of the Deaf and Dumb were sent out as soon as possible after the returns of the General Census were received; and only 40 persons—21 males and 19 females—were stated to have died during the interval, and 8 persons—5 males and 3 females—to have left the country. It must, however, be borne in recollection, when instituting comparisons between the former and the present decade, both as regards the Deaf and Dumb and all other sections of the community, that at the time the Census of 1851 was taken, and for a considerable period subsequently, the country was labouring under the effects of the great famine and pestilential period, which commenced in 1846, the natural consequences of which were excess of emigration and increased mortality.

As the Report upon the Status of Disease for the Census of 1851 entered at considerable length into the various subjects connected with the Deaf and Dumb, we consider that upon the present occasion an analysis of the Tables drawn up from the information obtained under the present inquiry, and a comparison of the results of the previous and the

present decade will be sufficient.

Identification of the Deaf and Dumb. When the final returns to the inquiry into the circumstances of the Deaf and Dumb in 1851 were received, a registry of the results was made, in which was preserved a record of the precise locality, name, age, sex, relationship to head of family, marriage condition, occupation, state of education, birth-place, cause of malady, and other particulars, for each of the 5,180 individuals included in the tables of Deaf Mutes given in the Status of Disease for that period. A similar registration has been made for those returned in 1861. By means of an index, we have, with few exceptions, been enabled to follow the course of each individual case for the past ten years; and, by comparison with the registry compiled from the returns of 1861, we have been able to make a more minute and faithful examination into all the circumstances of this class of the community than, we believe, has been effected in any other country of which the records have been published.

Where the names of individuals appearing in the registry of 1851 were not to be found in that for 1861, the Enumerators were again communicated with, and from this tertiary inquiry the following remarkable facts were arrived at:—In 186 cases the words "Deaf and Dumb" had been omitted in enumerating them on Form A; 975 had died; 254 had emigrated; 2 were females, who had married and taken other names; in 9 instances the individuals had changed their residences; 158 errors arose from alterations in orthography—for example, Cleary for O'Leary, M'Guigan for M'Wiggan, Hamlin for Hanlon, Rourke for Bourke, Barrow for Barron, Bryan for O'Brien, Quillenan for Cullenan, Quin for Guinn, and other cases of "Mac's" and "O's"—all natural mistakes in enumerating persons who could not pronounce their own names. In as many as 117 cases returned as Deaf and Dumb in 1851, it was found that they were not regarded as Mutes by the Enumerators of 1861. These, for the most part, consist of Idiots, children who were so young in 1851 that it was not possible for unskilled persons to determine what amount of speech or hearing they possessed,—some persons with great impediment of speech, and a few impostors. In 397 cases no account could be obtained of those returned in 1851.

Explanation of Table I.

Congenital Muteism.

The foregoing Table shows by Provinces the total number of Deaf mutes from all causes in the different counties, cities, and certain large towns in Ireland; and Table II. on pages 6 and 7 gives the proportions which the Deaf and Dumb bear to the population of their respective localities, as also the proportions of sexes. Table I. is divided into the Deaf and Dumb and the Dumb not Deaf—the former numbering 4,930, and the latter 723. The true Deaf and Dumb, born with defect of the organ of hearing, and styled in the Table "congenitally or from birth," and which class may be taken as most faithfully representing the actual amount of Deaf-dumbness in any country, were, upon the inquiry instituted on the 7th of April, 1861, as many as 4,010, or 476 more than were afforded by the Returns of 1851, while the population has decreased by 753,418 persons. In 1851, the proportion of This increase this class to the population was 1 in 1,573, while in 1861 it was 1 in 1,370. in the relative proportion of the true Deaf-and-Dumb to the population between the former and the present decade, may be accounted for by the immense extent to which emigration has increased between 1851 and 1861—the emigrants being generally the most healthy persons in the community, while the Deaf and Dumb were left behind, either with relatives or in public institutions. But with respect to the absolute increase, it must be either acknowledged as a lamentable fact, or partially accounted for by the belief that the present Census has been more accurate in its details than the former—a circumstance not to be wondered at, considering the state of the country in 1851. The proportion of the sexes among the true Deaf-mutes is, according to the present Returns, 100 males to 80.58 females—thus presenting a greater number of females than in 1851, At that time, however, the general when there were 100 males to 74.50 females.

Census Returns showed an undue proportion of females over males in Ireland. As THE DEAF in 1851, so also on the present occasion, we have in these Tables distributed throughout their different homes the pupils in public institutions, otherwise the counties of Dublin, Londonderry, and Tyrone, and the city of Belfast, in which institutions for the Deaf-and-Dumb are situated, would present an undue proportion of this class. localities in which there has been the greatest absolute increase of Deaf-dumbness, compared with the returns of 1851, are Dublin, Down, Monaghan, Sligo, Armagh, Tyrone, Donegal, Antrim, and Cork; and in proportion to their population, congenital muteism is greatest in the counties of Donegal, Dublin, Carlow, Cork, Tyrone, Armagh, and Kilkenny, the average proportion among which has been 1 in 1,148; and those localities in which the proportion to the population is least, are Carrickfergus, Kilkenny City, Belfast, the suburbs of Dublin, and Limerick and Waterford Cities the suburbs of Dublin, and Limerick and Waterford Cities.

To the 4,010 persons returned as born deaf and dumb should be added a portion of the 186 persons deaf and dumb, but the cause of whose infirmity was either uncertain or unknown, and also a certain proportion of infants and young children, from birth to the speaking age, but whose defect had not been discovered at the time of taking the A deficiency in the returns for early life must, however, occur in all such inquiries, as the difficulty of determining the question of congenital deafness and consequent muteism under two years of age is considerable, and there is always a great unwillingness on the part of friends and relatives to believe in the existence of deaf-dumbness in children under two and a-half or three years of age. According to the calculations made in 1851 those returned as "uncertain or unknown," were divided proportionally among the congenitally affected, and those whose deafness was acquired by accident or disease after birth. Adopting a similar course for 1861, it would increase the number of known congenital mutes to 4,257 or 1 in 1,370 of the population, irrespective of those who may be, and no doubt are, Deaf and Dumb under the speaking age.

In the second compartment of Table I. have been arranged, by sexes and localities, those Acquired who have become Deaf and Dumb from accident or disease acquired after birth: they amount to 598 persons—296 males, and 302 females; or 179 more than those returned as mute from the like causes in 1851. The proportion of this class to the population was, in 1851, 1 in 11,258, whereas, according to the present inquiry, the proportion has risen to 1 in 8,307. The Counties of Dublin, Kilkenny, Limerick, Tipperary, and Waterford, and the City of Limerick, present the greatest amount of acquired Deaf-dumbness, compared with their population. The causes of acquired muteism will be described in Table XII.,

and reported on at page 25.

The third section in Table I. includes those persons returned as Deaf and Dumb in the Muteism of original enumeration forms, but respecting the cause of muteism in whom, whether uncertain congenital or acquired, it was not possible to obtain satisfactory information at the time of making the secondary inquiry. Many of these persons were mendicants or travellers, who had left the locality in which they were originally enumerated upon the night of the 7th of April, 1861, prior to the time the secondary inquiry was instituted. In 1851 this class numbered 327, while upon the present occasion, although the total of the Deaf and Dumb is greater, the "uncertain or unknown" only amount to 186. This circumstance, we think, strengthens the opinion already expressed, as to the greater accuracy of the present inquiry, than that taken on any previous occasion.

In the fourth division of this Table have been arranged the Deaf and Dumb who Paralytic or

were at the same time paralytic or idiotic, or who laboured under both these calamities, Idiotic and who amount to 136, or 331 less than the number of that class afforded by the returns Mutes. for 1851. Of these 136, as many as 77 were males and 59 females—86 were congenital cases, and 50 were said to have become Deaf Mutes from accident or disease acquired subsequent to birth; the same disease of the brain and nervous system having in all pro-

bability, produced loss of hearing as well as paralysis or idiocy.

In the second general division of Table I. are included the Dumb not Deaf, who The Dumb amounted to 723—the sexes being 442 males and 281 females. This number exceeds not Deaf. by 290 the return for the same class in 1851. Of the total 723, as many as 265 persons were dumb without other defect, 96 were also paralytic, 270 were idiotic as well as dumb, and 92 were both dumb, paralytic, and idiotic. The particulars of several of these cases will be found at page 21.

The total number of Mutes returned upon this Table, both Deaf and Dumb and Dumb not Deaf, is 5,653—the sexes being in the proportion of 100 males to 80 49 females, and the provincial distribution as follows:—In Leinster there were 1,303; in Munster, 1,559; in Ulster, 1,949; and in Connaught, 842. Compared with the returns for 1851, this Table shows an increase of 473 persons, the sexes being 185 males and 288 females.

Table II., upon pages 6 and 7, is explanatory of the foregoing, and shows the proportion which the Deaf Mutes, both congenital and acquired, bear to the populations of the of Table II.

different Counties, Cities, and Provinces in Ireland. The general results afforded by this Table have been already explained at page 4.

Ratio of the Deaf and Dumb to the population.

According to the Provincial Summaries, the proportion of the total Deaf and Dumb were to the population—in Leinster, 1 in 1,301; in Munster, 1 in 1,098; in Ulster, 1 in 1,123; in Connaught, 1 in 1,256; and for the kingdom in general, 1 in 1,176. The proportions, however, vary somewhat, both as regards the congenital and acquired cases, also with respect to their civic and rural distribution. Of the congenital cases, which may be taken as expressive of the true amount of Deaf-dumbness arising from what may be termed natural causes, such as hereditary predisposition, consanguinity, &c., the proportion afforded by the present Census is 1 in every 1,370 of the population, or 1 in every 1,983 in the civic and 1 in every 1,274 in the rural districts: the sexes being 100 males to 80.58 females. Among the acquired cases produced by accident or disease occurring after birth, the proportion is only 1 in 8,307, varying so slightly as from 1 in 8,158 in the civic to 1 in 8,345 in rural districts: the sexes being 100 males to 102.34 females.

From an examination of the foregoing Table it would appear that the congenital cases

are least amongst the civic and most in the rural population, in the proportion of 64 of the former to 100 of the latter. In the returns for 1851, the relative proportions among the congenital Mutes were 81 in the civic to 100 in the rural districts; and on comparing the sexes we find, on the present occasion, some increase of females in proportion to males. With respect to the acquired cases there is a considerable proportionate increase compared with the returns of 1851, when the ratio was only 1 in 11,258, but the Military and Naval Forces serving in Ireland were not included in the General Population for that period. This description of Muteism, as was remarked on the former occasion, prevails most in crowded cities and towns, where the youth of both sexes are more particularly exposed to accidents, scrofulous affections, and those deleterious circumstances which arise from density of population, unwholesome food, impure air, and insufficient light and sewerage.

"世三一位一件

K

Table III., on pages 8 and 9, shows by sexes, the ages of all the individuals specified in the foregoing Tables. It differs from that afforded in 1851, inasmuch as while on

Ages of the Deaf and Dumb.

<sup>\*</sup> In the foregoing 5,798,564 persons, comprising the population of Ireland at the time of taking the Census of 1861, there have not been included 403 persons belonging to shipping, who received Census Forms at English ports prior to the 7th of April, and delivered such Forms at ports in Ireland from the 8th April to 15th May following.

THE DEAF AND DUMB.

Ages and Sexes.

\* This number comprises 3 Seceders, 3 Unitarians, 1 Separatist, 1 Jew, and

that occasion the ages were afforded by decennial periods after 20 years, they are now given in quinquennial periods from under 5 to 90 and upwards. The ages at which the greatest number of Deaf Mutes were returned, both in 1851 and 1861, were from 10 to 15 years.

As many as 40 of the persons enumerated in the foregoing Tables were confined in Lunatic Asylums at the time of taking the Census, viz., 12 Insane and 4 Idiotic Males, and 16 Insane and 8 Idiotic persons returned Dumb, but not Deaf.

Table IV., also given above, shows by sexes and localities the Religious Professions of the 5,653 Deaf Mutes specified in the foregoing Tables. From this it would appear that 791 were of the Established Church, or 1 in every 875 of that persuasion; 4,275, or 1 in every 1,054, were Roman Catholics; 522, or 1 in every 1,002, were Presbyterians; 27, or 1 in every 1,681, were Methodists; 3, or 1 in every 1,511, were Independents;

Insane and Idiotic Deaf and Dumb.

Religious Profession.

25 whose religious professions could not be ascertained.

1 was a Baptist, 1 belonged to the Society of Friends, and 33, or 1 in every 531, were of other persuasions, as specified in the foot note to the Table. Dividing the Religious Professions in Ireland into two classes, those who belong to the Roman Catholic Church and those who do not, the proportion of the Deaf and Dumb from all causes is 1 in 1,054 in the former, and 1 in 939 in the latter.

This disparity may be accounted for by the fact that all the pupils in the Claremount, Moneymore, Strabane, and Ulster Institutions, no matter from what source received, have been reared in the tenets of the Established Church, and returned as such in the column for Religious Profession. In compiling this and all other County Tables, the pupils in Institutions have been distributed throughout the localities from which they were derived, or in which their parents resided at the time of their admission. In twenty-five instances,—

THE DEAF AND DUMB.

chiefly of mendicants—the Religious Profession could not be ascertained: their localitie not being known at the time of making the secondary inquiry.

Mutes in In calculating the proportion of any particular class of the population, the greater the workhouses. amount the nearer we approximate to the truth.

In 1851, there were 296 Mutes in the Irish Workhouses, of which number 28 were als idiotic and lunatic. At the time of taking the Census of 1861 there were, as specific upon Table V., on the opposite page, only 223 Mutes, or 73 less than those returne on the former occasion; and of this number, 33 were also either idiotic or paralytic; of the remainder, 35 were educated—15 males and 20 females. Four Mutes were under 5 year of age; 14 were aged between 5 and 15—the school age—but who were returned to us a uneducated; and 137 were over 15 years of age. When reporting upon the Deaf Mutes resdent in Workhouses in the various Unions of Ireland in 1851, we took occasion to ca special attention to the number and condition of those young persons who were then of a age susceptible of instruction, as they constituted the only portion of this afflicted class fo whose support a State provision had been made, under the Poor Law Act, 6 and 7 Vict cap. 92, sec. 14. It is gratifying to find, that the number of Deaf Mutes in the Irisl Workhouses of the "school age" has decreased during the last ten years from 76 to 14 The Unions which contained Deaf Mutes, but in which the Guardians had not availed themselves of the provisions of the Act above referred to, which enables them to send the destitute Deaf and Dumb to asylums suited to their age and condition, are those o Antrim, Ballina, Bawnboy, Clogheen, Cork, Dublin South, Enniskillen, Fermoy, Kilmac thomas, Lurgan, Millstreet, New Ross, and Thurles; and to these, as well as to the Poor Law authorities generally, we would again venture to observe, that "As Mute children, permitted to grow up in ignorance and poverty, must remain a permanent tax upon their respective Unions, and as they cannot be properly instructed except in schools specially constituted for the purpose, we think it might be found an eventual economy to have them sent to some of the existing seminaries, that they may receive both a literary and industrial education."

Occupations of Deaf and Dumb.

Deaf Mutes.

Table VI., on pages 12 and 13, presents us with the occupations of the Deaf and Dumb by ages and sexes, and includes the numbers both of the congenital and the acquired. It differs from that afforded by the Status of Disease given in 1851 in not being arranged alphabetically, but according to the general classification now adopted for the occupations of the community at large in other portions of our Reports. This table shows to a certain extent the occupations of which Deaf Mutes are susceptible—at the same time it must be admitted that a certain number of this afflicted class adopt their trades and employments from the circumstances in which they may be placed.

At the period of the last decennial inquiry it was found that 135 persons—78 males and 57 females—were returned as mendicants or strollers; whereas upon the present occasion, although the general total of the Deaf and Dumb is greater, there were only 52 persons

so returned, of whom 11 were males and 41 females.

The number of the Deaf and Dumb at School in 1851 was 234, while on the present occasion it amounts to 458, or nearly double, the sexes being 250 males and 208 females. This increase is mainly owing to the additional accommodation afforded by St. Mary's and St. Joseph's Roman Catholic Asylums, in the vicinity of Dublin, which are altogether

supported by voluntary contributions.

In 1851 the number returned in the Table of Occupation as "unspecified," was 2,830 on the present occasion it is but 2,376. Of the total specified, 1,045 were employed in the production of food, of whom 865 were agricultural labourers, viz., 809 males and 56 females; 473 of the Deaf and Dumb with specified occupation, 173 males and 300 females have been arranged under the head of those whose industry ministers to clothing in which number are included 187 seamstresses. Ministering to lodging, furniture and machinery, we find 454 persons, of whom 368 were domestic servants, 288 females We find 25 arranged under and 80 males; 11 were blacksmiths, and 19 carpenters. that class which ministers to transport and travelling, of whom 13 were sailors, and 6 saddlers and harness makers. Nineteen were employed in occupations connected with literature, of whom 10 were printers.

Comparing the occupations afforded by the Returns of 1851 with those of 1861, we find that there is, upon the whole, a proportionate increase of handicrafts among Mutes

Occupations Table VII., occupying pages 14 and 15, is much more extensive than that of Parents of afforded for the same subject in 1851—containing but 85 specified occupations, while of the present occasion we have received as many as 114—a fact which shows that the more frequently statistical inquiries are instituted, the greater is the amount of accuracy and minuteness obtained. From this table we learn that the agricultural classes—farmers farm labourers, and herds, amounting to 1,793 instances—furnished the great majority of the Deaf and Dumb whose parents had specified occupations; 193 belonged to

Table V.—Showing the Number and Sexes of the Educated; and the Number, Ages, and Sexes of the Uneducated Deaf Mutes, in Union Workhouses, on 7th April, 1861.

THE DEAD'

Occupations of Parents of Mutes.

THE DEAF AND DUMB.

Occupations of Parents of Mutes.

the class of tradespeople ministering to clothing, of whom 77 were weavers, 27 boot and shoe makers, and 20 tailors; in 152 instances, including 23 domestic servants, the parents ministered to lodging, furniture, and machinery. Among the handicrafts, the parents of Mutes were, in 35 instances, carpenters and cabinetmakers; in 22, blacksmiths; and in 16, masons or bricklayers. Of the class ministering to transport and travelling, there were 34 instances of persons whose offspring were Deaf and Dumb, in 11 of which the parents were carmen and carriers. In 17 cases the parents belonged to the class that minister to literature and education; in 4 to health, in 19 to justice, and in 8 to religion.

Amongst the Unclassified, amounting to 121, irrespective of the Unspecified, 29 instances occurred in which the parents belonged to the nobility and gentry; in 19 cases the parents were shopkeepers; in 14, porters; in 12, pensioners; and in 13, hawkers

and dealers.

In examining into the causes of Deaf-dumbness, and making use of the results of such statistical information as that afforded by Table VII., the number of congenital and acquired cases should be carefully distinguished, as well as those who were dumb only, or affected with Paralysis or Idiocy. Thus, of the farming class, ministering to

food, who all reside in rural districts, and whose occupations are carried on in the THE DEAF open air, we find the proportion of cases of Deaf-dumbness acquired by accident, or disease after birth, to be 1 in 9.56; in those ministering to clothing, and who Occupations altogether belong to indoor trades and occupations, the proportion is, for the entire of Parents of class, 1 in 9.05; and for those ministering to lodging, furniture, and machinery, 1 Deaf Mutes. in 7.28. Of those ministering to transport and travelling we have not a sufficiently extensive series of observations to found any reliable opinions upon; but so far as the present inquiry serves, the proportion of congenital to acquired cases is very high.

By means of the subjoined Table VIII., we have, in continuation of the inquiry com- Number of menced in 1851, shown the number of Mute children in each family, and so far as we Mutes in are aware, born of the same parents. We have also given the sexes in each particular a family. class, as regards the 3,710 instances contained in it; and included both the living and the dead, or absent, but not the acquired or uncertain cases, nor the Dumb not There were ten instances of twins in each of which both children were Deaf and Dumb, and in 3,138 cases—1,779 males and 1,359 females—there was 1 Mute in each family. These numbers are somewhat more than those returned in 1851, but the relative proportions of the sexes vary but little, being 100 males to 72:35 fe-

the Number of Congenital Mutes in each Family.

THE DEAF and Duns. Number of Mutes in a family.

males in the year 1851; and 100 males to 76.39 females in 1861. In these, and all similar instances, it must be remembered, that the proportions are made upon returns obtained for each family on a certain day or week; subsequent to which, it is possible, that other Mutes may have been born to the same parents; or that in some of the other children the malady had not then been discovered; and again, other Deaf Mutes in the family may have died before they arrived at the speaking age; -such exceptional cases must, however, always occur in investigations of this description. In 357 instances there had been born two Mutes in each family; in 107 of these the Mute children were both boys; in 75 both girls,—and in 175 a boy and a girl. 159 instances occurred of three Mutes born of the same parents, and in these the combination of sexes was as follows:—In 28 cases all three were males; in 23, all females; in 48, two males and a female; in 60, one male and two females. In 36 instances four Mute children occurred in a family, the sexes, being in four cases 4 males, in two 4 females, in eleven 2 males and 2 females, in ten 3 males and 1 female, and in nine 1 male and 3 females. In this combination the same results appear as in 1851, when in the great majority of the instances of four Mutes in a family, the Thirteen families had each five Mutes, being 4 more of this class than sexes were equal. were afforded by the returns of 1851. The most frequent combination of sexes in this class was where two males and three females were born Deaf and Dumb, of which 4 instances occurred. The like circumstance was established upon our former inquiry, and altogether the results afforded by this minute investigation of the circumstances of the Deaf and Dumb, taken in connexion with our previous investigations, lead us to suppose, that all these combinations of sexes are influenced by some natural law, whose fixity excites our wonder, but the cause of which we cannot explain. Six Mutes in a family occurred five times; in three instances of which the sexes were equal; in one the Mute offspring were all females, and in the fifth 5 males and 1 female. In this latter case the father was also Deaf and Dumb. In one of these cases no less than four returns were received from members of the family residing in different parts of the country, but by means of the Index to which we have already referred at page 4, the liability to inaccuracy by a double entry of such cases was rendered almost impossible. In one case there were no less than seven Mutes born of the same parents, the sexes being 2 males and 5 females. There was neither hereditary predisposition nor any other probable physiological or pathological reason assigned to account for this very remarkable peculiarity. 1851 there was a remarkable instance of a family of 7 Mutes, all females, 6 of whom were twins, occurring in the County of Sligo, and in which the parents were third cousins (see Status of Disease for 1851, pp. 14 and 17). Upon recently inquiring after the only Mute survivor of this family we found there had been 8 Deaf and Dumb children born in it, as set forth in the foregoing Table.

In our Report for the previous decade, we remarked upon the circumstance of a family of 8 Mutes born of the same parents, returned as from the Parish of Burt, County of Donegal; upon making inquiry in 1861, it was found that there are no longer any members of that family in the locality, and that the mute person belonging to it, who was returned in 1851, had lost her life by the fire which occurred in the Strabane Asylum in the year 1855.

Twin Mutes.

Returns have been received of thirteen instances of twins, in which one or both were born deaf and dumb; of these, in ten cases both children were mute, and in the remaining three, only one was so afflicted. These twin cases occurred in the counties of Donegal, Down, Fermanagh, Galway, Kilkenny, Leitrim, Mayo, Meath, Sligo, Tipperary, Tyrone, and Waterford. Of the thirteen instances, the sexes were—in three cases, both males; in four, both females; and in six instances, a male and a female. In the three cases of one child only being born deaf and dumb, the sexes were, in one instance, two females, and in the remaining two, a male and a female. In two instances, other members of the family were also mute; and in two the parents were related. Of the foregoing twin cases, one was a first birth, four were second births, three were third, one was the fourth, one sixth, and one a tenth birth; in the remaining two instances, the twins were the only children in the family.

Position in

In order to arrive at some conclusion with respect to the position which Deaf and family of a Dumb children usually occupy in their respective families, Table IX., on the opposite single Mute page, has been constructed. By it we learn, in 3,039 instances out of 4,010 cases of single congenital Mute children, the place which each child held in the family on the 7th of April, 1861;—the remainder being unspecified. By an examination of this table it will be perceived that by far the greatest proportion were first children, and from Table X. that families of six and seven had more frequently a Mute child born among them than families consisting of any other number. The same observation was made in the Report for 1851. Except in two instances the male sex largely predominated, the

Mutes being the 12th and 13th born. The place, however, which Deaf Mutes occupy The Dank in a family is very various; but the number of instances in which the first and the last child in the family (at the time of our inquiry) was Deaf and Dumb is remarkable; Position in they amount to 710 in the former case and 670 in the latter out of 3,039 cases.

family of a single Muta

twenty-nine, all born of the same parents; the latter, now aged sixty-five, and to whom reference was made in 1851, is still living in the county of Cork.

THE DEAR AND DUMB.

Causes of congenital Muteism.

Consanguinity of Parents.

Among the remote causes of congenital muteism, may be enumerated too close consanguinity, or the intermarriage of relatives, and also hereditary predisposition. The former cause has long been regarded as an established fact, and the inquiries instituted in 1851 largely tended to confirm it. Having repeated these inquiries under the present Commission, the replies thereto have afforded the following information:—

In 242 instances the parents were related in the degrees of either first, second, third, or fourth cousins. The result of these intermarriages was 154 cases of one Mute in a family, of which all except 2 were congenital. Of these 119 were deaf and dumb; 4 deaf, dumb, and idiotic; 2 deaf, dumb, idiotic, and paralytic; 2 deaf, dumb, and blind; 8 dumb only; 13 dumb and idiotic; 2 dumb and paralytic; and 2 dumb, paralytic, and idiotic. the 2 acquired cases, 1 was deaf and dumb, and 1 dumb only. 47 cases of deaf-dumbness occurred, in which two of the family thus connected were affected (including two of the cases of twins already specified), 45 being congenital, and 2 acquired. 23 instances were recorded of three mutes in a family, in 2 of which cases the affection was dumbness only, and in 1 dumbness with idiocy. Of the remainder, 10 instances occurred, in which four of the same family were deaf and dumb; and 5 cases where five in one family, the parents of which were related, were deaf and dumb. In 2 of the cases of six; and also in the case of eight deaf and dumb in one family, the parents were related. In the latter case, three instances of twins occurred; and in one of the cases of four deaf mutes, the mother had been married twice, each husband being a relation of hers, and the children of both marriages were affected.

Family peculiarity and hereditary taint. The transmission of muteism by hereditary taint or family peculiarity has been fully established by the Irish returns, as shown in the following table, which is divided into two sections: the first includes those cases where the disease was transmitted through the male parent; and the second where it was derived from the mother's side:—

Table XI.—Showing the Result of Hereditary Predisposition or Family Peculiarity in the Production of Congenital Muteism.

From this table it appears that in 211 instances, including 320 persons, born in families, some of the previous members or the collateral branches of which were mute, as many as 187 persons were born deaf and dumb, among those where the disease came through the male parent; and 133 where this congenital defect was transmitted through the female line. This tends to show that, contrary to the generally received opinion, the amount of morbid action was transmitted with greater intensity through the father than the mother. In this, as well as in the three foregoing tables, are included the dead or absent mute members of the family, as well as those enumerated in the Census returns on the night of the 7th of April, 1861. It not unfrequently occurs that muteism appears simultaneously in the cousins or other collateral branches of the family, without any of the previous members being affected. When, however, one of a family is born deaf and dumb, even without hereditary predisposition, or in which there was no relationship between the parents, not only are those descended from such a marriage liable to muteism, even after the intermission of a generation, but collateral branches of the same family occasionally exhibit the disease.

In addition to and in confirmation of the foregoing table we may remark, that in cases of single congenital muteism, where the relatives were also deaf and dumb, there were, by the father's side, in one instance, a granduncle and two cousins; in one, two grand-uncles, two grand-aunts, and one cousin; in one, an uncle and an aunt; in one, two aunts; in one, an uncle and five cousins; in two cases, an uncle and cousins (number unspecified); in sixteen instances, two cousins; in four, three cousins; in three, four cousins; in one, seven

cousins; and in one case, a niece and two cousins. Where two of the same family were THE DEAF affected with congenital deaf-dumbness, there were in two cases, an uncle and aunt AND DUMB. in a similar condition; in nine cases, two cousins; and in four instances, three cousins. Family Where three cases of congenital deaf-dumbness occurred in the same family, there were peculiarity two cousins deaf and dumb in three instances; and in one, three cousins. Where four and herediin the same family were deaf and dumb, there were in one instance two cousins similarly tary taint.

Where the relationship came by the mother's side, there were—in cases of single congenital muteism—one instance of two grand-uncles; one of a grand-aunt and two cousins; two instances, of three uncles; one, of two aunts; one, of an uncle and aunt; one, of an uncle, aunt, and cousins; nine, of two cousins; three, of three cousins; and one where four cousins were deaf and dumb. In cases of two mutes in the same family, we find that in one case an uncle, cousins (number unspecified), three nephews, and two nieces were also deaf and dumb; in six cases, two cousins; in two cases, three cousins; and in one case four cousins laboured under the like defect. Where three mutes occurred in the same family, there were in one instance, an uncle and aunt; and in one, two cousins, also deaf and dumb. Where there were five deaf and dumb children in one family, one

case occurred of two cousins being similarly affected.

In many instances it could not be ascertained from which side the hereditary taint or family peculiarity was transmitted. Amongst these there were, in cases of single congenital muteism, in one instance a grandmother; in one, a grandfather, father, uncles, aunts, and cousins; in one, a granduncle; in one, an uncle; in three cases, one cousin; in one, three cousins; in two instances, cousins (number unspecified); and in one, a male whose relationship was unknown. In one case where there were three mutes in the family, a step-uncle was also deaf and dumb. The following instances also occurred where there were deaf and dumb relations on both sides:—in one case the father and mother; in one, a paternal aunt, a maternal aunt, and two cousins; and in one, a paternal cousin and two maternal cousins. Five cases were recorded in which a niece to the deaf and dumb person was also mute; in four of these there was but one mute in the family; and in the other instance two were thus affected. In one case of two mutes in one family the father is stated to have had a great impediment in his speech. In one instance where three cases of muteism occurred in the same family, the grandfather and grandmother were step-brother and sister.

There have been returned the following instances of deaf mutes having had relations who were deaf only. Where there was but one mute in the family, in one case the mother is said to have been "born deaf, not dumb;" in one case the same fact is recorded of an uncle; in one, a father and brother were deaf; in two, an uncle was deaf; and in one, a grandfather and mother had lost their hearing, each at the age of 40 years. In one case where there were three deaf and dumb in the same family, the father was deaf.

Inquiries were made respecting the Marriage State among deaf mutes, together with the Marriage condition of the offspring of such marriages; from which it appears that 135 deaf and State of the dumb persons—76 males and 59 females—included in the first division of Table I., were, or Dumb. had been, married. In 129 instances of these—73 males and 56 females—only one of the parties was deaf and dumb. From the marriage of 91 of these persons, 213 children resulted, among whom there were only three instances of muteism, viz.:—one male in the county Meath, one female in the town of Belfast, and one male in the county Donegal. Three instances have been recorded of the intermarriage of persons both of whom were deaf and dumb; their offspring amounted to 12, none of whom were either deaf or In 32 cases in which one parent was deaf and dumb, no accurate information could be procured concerning the second parent or the offspring. In the foregoing enumeration of the children of mutes are included some instances of infants under one year of age whose hearing and speaking powers were undetermined at the time of taking the Census. It is remarkable, that while muteism is often found in several members of a family derived from a common stock, the defect is comparatively seldom transmitted direct from parents to children.

In the investigation of the 5,653 cases of the Deaf and Dumb, and the Dumb Only, set torth in Table I., many rare and remarkable instances occurred, which have been arranged

in the following order:-

Province of Leinster.—County of Dublin.—No. 5.\*—A female aged 50, became dumb, Rare or but not deaf, from an attack of paralysis when 23 years of age. No. 26.—A male, aged remarkable 10, dumb but not deaf, is one of the many instances related where the cause of the defect cases.

The numbers in this list refer to the registry described at page 4. The names are omitted from motives of delicacy. The statements respecting the supposed cause of disease given in answer to query 2 of the secondary inquiry are generally in the words of the replies.

Rare or remarkable

The Das is attributed by the mother to fright received during pregnancy. No. 54.—A male, aged Dune 40, when 28 years old, became dumb but not deaf, after an attack of cholers. No. 77.—A male, aged 7, was dumb from birth, but with perfect hearing; his dumbness was attributed to the "over anxiety of his mother when attending a sick relative." This child was of defec-

tive intellect, and died, subsequent to the 7th April, 1861.

Dublin City.—No. 4.—A female, (age unstated), is said to have become suddenly deaf-and-dumb at 5 years old "while taking a drink." No. 5.—A male, aged 31, became deaf-and-dumb at 9 years of age, owing to his brother having thrown him into the fire. No. 8.—A male, aged 32, deaf and dumb, and No. 11, a female, aged 19, dumb and paralytic; were attributed to fright of mothers during pregnancy. No. 36.—A female, aged 20, became deaf and dumb from fever when 7 years old. No. 37.—A female, aged 63, became deaf and dumb when 51 years old, from the same disease. No. 42.—A female, aged 13, became deaf and dumb from a fall when 3 years old. No. 45.— A male, aged 21, from like cause at 7. No. 47.—A male, aged 8, deaf and dumb; attributed by his mother to her "having got a fall while pregnant." No. 58—A female, aged 11, became deaf and dumb at 4 years of age from fever. No. 91.—A male, aged 19, became deaf and dumb at 7 years old "from the effects of a severe cold." No. 61.—A female, aged 19, became dumb, but not deaf, at 4 years old, by drinking boiling water from the spout of a kettle. No. 18.—A male, aged 53, is said to have become deaf and dumb from having been knocked down by a car. No. 32.—A male, aged 11 (in Claremont Institution), born deaf and dumb, is one of a family of 3 sons, all similarly affected, whose father and grandfather were mutes. No. 47.—A male, aged 12, lost his hearing at 7 years of age from hydrocephalus. No. 49.—A male mute, aged 14, is of diminutive stature and of limited intelligence; one sister, aged 12, is also similarly circumstanced; another sister, nearly adult, is deaf and dumb. No. 58.—A male, aged 15, at a very early age became deaf and dumb from a fall, which also caused permanent injury to the spine. No. 60.-A male, aged 12, became deaf when about 8 years of age, from an injury of the head; his speech subsequently declined, until he became dumb. No. 152.—A male, aged 16, (at Cabra Institution), is stated to have "slept in the open air" when 5 years old, and soon afterwards became deaf and dumb.

Kilkenny City.—No. 6.—A male, aged 40, while serving in the army in India became

deaf and dumb, in "consequence of sleeping out at night.

County of Kilkenny.—No. 19.—A female, aged 24, became deaf and dumb at 7, immediately after having had measles and cholera. No. 54.—A female, aged 30, when 8 years old, "went to bed well, and was deaf and dumb the following morning." No cause assigned. No. 88.—A male, aged 35, when at the age of 18 suffered much sudden anxiety, and is said to have become a deaf-mute in one night.

King's County.—No. 14.—A male, aged 20, fell into a canal, after having had fever, when 5 years old, and became deaf and dumb. No. 61.—A male, aged 50; at the age of 20

received a severe beating, from the effects of which he became deaf and dumb.

County of Longford.—No. 35.—A female, aged 20, at 14 years of age was affected with

sore eyes, and became deaf and dumb shortly afterwards.

County of Louth.—No. 20.—A male, aged 63, at the age of 30 went to bed in good health, and was dumb and "powerless" the following morning. No. 74.—A male, aged 18, became

deaf and dumb at 15 from "scrofula in the throat."

County of Meath.—No. 14.—A male, aged 25, became suddenly deaf and dumb at the age of 7;—no cause assigned. Nos. 30 and 31.—Two females (twins), aged 12, born deaf and dumb. They can now (it is said), hear and speak a little. No. 32.—A female, aged 30, returned as a deaf mute can now speak so as to be partially understood by those accustomed to her, and can hear a little. She has three sisters and one brother similarly No. 63.—A female, aged 13, is dumb not deaf, but is also idiotic, paralytic, and affected. epileptic.

Queen's County.—No. 26.—A female, aged 30. At 6 years of age fell on her head into a sand-pit, and became deprived of speech and hearing. No. 32.—A male, aged 24, became deaf and dumb at 6, from the effects of a blow on the forehead.

male, aged 36, became deaf and dumb at 10, from a coach passing over his head.

County of Westmeath.—No. 6.—A female, aged 28, became deaf and dumb at the age of 12, without any apparent cause. Nos. 21 and 22.—Brothers, aged 46 and 43 years respectively, became deaf and dumb at the ages of 10 and 8 years. No cause can be The younger is at present a lunatic. They have one brother deaf and dumb assigned. from birth.

County of Wexford.—No. 12.—A male, aged 22, when 4 years old had sores on his hip and the back of his head, from which portions of bone exfoliated, to which cause his deaf muteism is attributed. No. 20.—A male, aged 50, became deaf and dumb at 5 years old from exposure to cold. No. 37.—A male, aged 5, is mute, idiotic, partially paralysed,

No. 47.—A male, aged 15, became deaf and dumb at 15 from the kick THE DRAF of a horse on the forehead.

County of Wicklow.—No. 4.—A male, aged 62, born deaf and dumb; has four Rare or brothers, 2 of them deaf, and 2 deaf and dumb. No. 30.—A female, aged 19, dumb, remarkable and hearing imperfectly; suffers from a total want of palate. No. 72.—A male, aged cases. 35; when 5 years old had an abscess on the back of the neck, from the effects of which it is supposed he became deaf and dumb.

Province of Munster.—County of Clare.—No. 123.—A male, aged 19, became deaf and dumb, when 3 years old, "after 2 hours' illness." No. 126.—A female, aged 23, became deaf and dumb after an attack of influenza, at 3 years of age; a brother and sister were similarly affected, but died soon afterwards.

Cork City.—No. 21.—A female, aged 60, became dumb during childbed, at 25.

County of Cork, E.R.—No. 6.—A male, aged 24, was born dumb, but could hear up to the age of 12 years, when he became deaf "in consequence of sleeping out." No. 7.—A male, aged 45, became dumb at 17, from a fall from a gig. No. 10.—A male, aged 57, became deaf and dumb, at 4 years of age, from the kick of a horse. No. 43.—A female, aged 70 years; when 7 years of age "fell asleep in a fort," and, it is said, awoke deaf and dumb. No. 45.—A male, aged 53; at 5 years of age "went to bed well, and arose in the morning deaf and dumb." No. 186.—A male, aged 24, became deaf and dumb at the age of 12 "from soreness of throat and ears." No. 223.—A male, aged 50, at 17 years of age, fell from a tree and became deaf and dumb. No. 227.—A female, aged 20, fell from a window, and was immediately deprived of speech and hearing.

County of Cork, W.R.—No. 16.—A female, aged 20, became dumb at the age of 20

"from sleeping in the open air."

County of Kerry.—No. 26.—A female, aged 26, when 9 years old "got a lump below the tongue, which produced impairment of speech, and partial deafness." No. 67.—A female, aged 28, became deaf and dumb at 3 years of age from a severe burn. No. 131.-A male, aged 60; when 5 years old became deaf and dumb from the kick of a horse on

County of Limerick.—No. 77.—A female, aged 50, became deaf and dumb at 2 years old,

from the wheel of a car passing over her.

County of Tipperary, S.R.—No. 6.—A female, aged 6, born dumb only, has a fissured palate. No. 72.—A male, aged 28, when 12 years old "became dumb in one night." No. 98.—A female, aged 18, became deaf and nearly dumb after fever, at 7 years old. No.

121.—A male, aged, 40; when 8 years of age became deaf and dumb while bathing.

County of Waterford.—No. 8.—A male, aged 44; at 3 years of age became deaf-anddumb from sudden immersion in water. No. 90.—A male, aged 13, was born deaf, dumb, idiotic, and paralytic. His grandmother was insane. No. 96.—A male, aged 60, became deaf and dumb at 9 years of age, "after hemorrhage from the nose, occasioned by a fall."

PROVINCE OF ULSTER.—County of Antrim.—No. 29.—A male, aged 36; when 13 years of age lost his sight, from which, however, he recovered, but became deaf and dumb. No. 163.—A female, aged 25, at the age of 7 "became suddenly deaf and dumb during sleep."

Belfast Town.—No. 20.—A male, aged 28, at 3 years of age fell on his head from a window, and became deaf and dumb. No. 35.—A male, aged 22; at the age of 7 became deaf and dumb from a fall from a height. No. 44.—A male, aged 10, when 5 years old was beaten by his mother and placed in a dark coal-hole, when he became dumb and idiotic. No. 59.—A female, aged 11 (in The Ulster Institution), at 3 years of age

became deaf and dumb. Attributed to a hurt from a cock.

County of Cavan.—No. 109.—A male, aged 8, was born deaf and dumb; both ears are completely closed; his features are contracted, and head depressed. No. 140.—A female, aged 24, was born dumb, and is paralytic and idiotic. No. 145.—A male, aged 50, at the

age of 6 became deaf and dumb from disease in the throat.

County of Donegal.—No. 57.—A female, aged 40, at the age of 6 became deaf and dumb from sleeping in the open air. No. 138.—A male, aged 30, became deaf and dumb at 10 years of age from influenza. No. 151.—A female, aged 30, became dumb only, at 16 years of age. Cause supposed to be a fright received during sleep. No. 182.—A male, aged 46, at the age of 4 became deaf and dumb "from sleeping out." No. 243.—A fe-

male, aged 28, at 12 years of age was severely burned, and became deaf and dumb.

County of Down.—No. 79.—A female, aged 29, became dumb from cold caught in childbirth. Nos. 87 and 88.—A male and female (twins), aged 11, were born deaf, dumb, deformed, and idiotic. No. 131.—A male, aged 14, at the age of 8 years became deaf and dumb from nervous debility and cold. No. 175.—A male, aged 56, is stated to have become deaf and dumb when 5 years old from a fall. No. 176.—A male, aged 10,

THE DEAF AND DUMB. Rare or remarkable cases.

at 6 years of age "had some affection of the eyes, after which he became deaf and dumb." No. 211.—A male, aged 15, became deaf and dumb at the age of 13 " from sore head and eyes." No. 222.—A male, aged 6, born dumb, but not deaf; is blind of one eye, and idiotic. He is also unable to walk, but can stand, and has the use of his arms. No. 230, a female, aged 40, became deaf and dumb when 10 years old;—superstitiously attributed to "her father having cut down a white-thorn bush in a fort." Her brothers and sisters can hear and speak, but imperfectly.

County of Fermanagh.—No. 19.—A male, aged 80, at the age of 55 became deaf and dumb from a fall. No. 66.—A female, aged 50, became deaf and dumb at 14 from a fall. County of Londonderry.—No. 25.—A female, aged 7, born deaf and dumb, has a defect in the spine. No. 73.—A female, aged 20, born deaf and dumb, has club feet. 126.—A female, aged 39, became deaf and dumb at 30 from a fright received in childhed. No. 140.—A male, aged 23, became deaf and dumb at 6. His muteism is attributed

to a scald he received from sucking a teapot. He has two brothers deaf mutes.

County of Monaghan.—No. 8.—A male, aged 6, was born dumb only. Attributed to his tongue being too large; he most frequently keeps it out of his mouth. No. 85.—A male, aged 105, is stated to have become deaf and dumb at the age of 103. No disease specified. His father had been deaf and dumb.

County of Tyrone.—No. 145.—A female, aged 52, became deaf and partially dumb in

childbed, at the age of 40.

Province of Connaught.—County of Galway.—No. 69.—A female, aged 18; at the age of 4 had lumps in her throat and became deaf and dumb. No. 101.—A female, aged

80, became dumb at the age of 67. No cause assigned.

County of Leitrim.—No. 27.—A female, aged 10, at 3 years old became deaf and dumb; supposed to be from water on the brain. She had one sister who, it is said, "became deaf and dumb on the same day and hour, but who died in twenty-eight hours after." No. 77. -A male, aged 20, born dumb, is idiotic. "At present the measurements of his head do not exceed those of a new-born child. He hears well, and can imitate musical sounds."

County of Mayo.—No. 20.—A male, aged 4, at 3 years of age, on awakening from sleep, complained of illness; and, at the expiration of ten days, became deaf, dumb, idiotic, No. 36.—A male, aged 36, born dumb not deaf, at about 6 years old was and epileptic. beaten on the temples by a cock, when he lost his hearing. No. 154.—A female, aged 54, at the age of 9 " was knocked down by a blast of wind and became deaf and dumb."

County of Roscommon.—No. 4.—A male, aged 3, was born dumb, but not deaf; he shows symptoms of idiocy, and his father died insane. No. 19.—A female, aged 33, at the age of 4 became deaf and dumb—cause unknown. No. 71.—A female, aged 39, at 4 years of age became deaf and dumb from "disease in the ear." No. 79.—A male, aged 7, born

deaf and dumb. Was the son of an idiot mother.

County of Sligo.—No. 34.—A male, aged 50, at the age of 40 became dumb only, "from a fright caused by imprisonment." No. 37.—A female, aged 28, became deaf and dumb at 9 years of age, after two years' illness, occasioned by a hurt on the thigh. Her aunt and uncle were deaf and dumb. No. 45.—A female, aged 8, became deaf and dumb at 25 years old, "after being seized with weakness." No. 47.—A male, aged 70; "in his 56th year knelt down to pray, and was suddenly struck deaf and dumb [it is said]. His clothes were very wet at the time. His father was dumb for a year previous to his death." No. 98.—A male, aged 40, when 20 years of age became deaf and dumb; attributed to a hurt.

The Deaf, Dumb, and Blind.

In addition to the foregoing list—the causes of muteism in which are, for the most part, given in the words of the friends or relatives of the persons affected, and afford good exemplifications of the popular opinions which in many instances are entertained with respect to the causes of deaf-dumbness—there have been returned to us 12 instances of persons deprived of the senses of both sight and hearing, viz.:-

In Dublin City.—No. 134.—A male, aged 20, was born deaf, dumb, and blind; cause unknown (see description of this case in The Status of Disease for 1851, p. 22).

King's County.—No. 56.—A male, aged 18, is said to have become blind when 14 months old, and deaf and dumb at 6 years. He is paralytic and idiotic. No. 57.—A male, aged 40, is deaf, dumb, and blind; the latter malady is attributed to amaurosis. No. 58.—A female, aged 45; entered the Edenderry Workhouse deaf, dumb, and blind. Nothing further could be ascertained respecting her.

County of Louth.—No. 16.—A female, aged 14, was born deaf and dumb, and became

blind at 14 years; cause unspecified.

County of Antrim.—No. 44.—A female, aged 19, with deformed head, was born deaf and dumb, and became blind at 4 years of age (proximate cause unstated). Her parents were second cousins. No. 47.—A boy, aged 6, blind and idiotic at birth, is said to have become dumb when 3 years old (cause unknown). No. 75.—A male, aged 47, born deaf, The Deaf

dumb, and blind. His parents were cousins.

County of Armagh.—No. 162.—A female, aged 20, was born partially deaf and dumb, Blind Mutes.

and became partially blind at 15 (cause unknown).

Belfast Town.—No. 35.—A female, aged 14, in the Ulster Institution, was born deaf, dumb, and blind. Her muteism is assigned to hereditary predisposition.

County of Down.—No. 143.—A girl, aged 8, became blind, deaf, and dumb at 4 years of age from "a pain in the head."

County of Tyrone.—No. 6.—A boy, aged 14, was born blind, dumb, and idiotic.

County of Clare.—No. 89.—A boy, aged 2, was born deaf, dumb, and blind. His parents

County of Tipperary.—No. 133.—A male, aged 36, became deaf, dumb, and blind, when

15 years old; the latter affliction from ophthalmia.

County of Galway.—No. 162.—A male, aged 26, became dumb and idiotic when 18 months old, from water on the brain, and blind at 8 years of age. See record of this case in Status of Disease for 1851—page 23.

Of the 19 cases of persons returned as deaf, dumb, and blind, in 1851, and of whom 9 were likewise paralytic and idiotic, it appears from recent inquiry that 9 had died during

the subsequent ten years.

Having in the foregoing report and tables stated the amount of congenital deaf- Cases of dumbness, and the circumstances which appear to influence it, we now come to the acquired consideration of the causes of muteism acquired after birth, and which are set forth in Table XII. upon the two following pages. By this table we learn that of the 4,744 deaf and dumb of whom the circumstances are known, (and exclusive of the dumb, not deaf,) as many as 648 persons—321 males and 327 females—had become deaf-mutes by disease or accident occurring after birth. Of the 723 persons dumb only, 115, viz., 65 males and 50 females, had become so subsequent to birth. In this table the age-period commences at the beginning of the third year, as it is scarcely possible, unless special and skilled attention should have been previously directed to each case under that age, to determine by any means within the power of the statistician, whether the defects of hearing and speech were acquired between birth and that period. As upon a former occasion, so have we now to remark that an examination of the age-period in this table (which is much more extensive than that given in 1851), shows that the chances of becoming mute very much lessen as life advances. Thus, out of the 648 cases, 227 occurred between the end of the second and the beginning of the fifth year; 200 during the fifth, sixth, and seventh years; 86 from the seventh to the end of the tenth; and only 109 from that onwards. same time it must be remembered that, while persons who have lost their hearing in very early life by accident or disease, also lose in whole or in part the faculty of speech, those who do not become deaf until a later period, seldom lose altogether the art of speaking.

In accordance with the formula published in 1851, the diseases and accidents which Diseases and produce total deafness, and, as a consequence, subsequent loss of speech, have, for the sake accidents of classification, as well as for comparison with former investigations, been divided into Muteism. The first includes those affections which act locally on the organs of hearing, and which are chiefly owing to epidemic diseases, such as scarlatina, measles, small-pox, &c., and which impair the functions of hearing by producing organic lesions of the mechanism of the auditory apparatus. In this section scarlatina is by far the most frequent cause of acquired deaf-dumbness by producing, not merely suppuration of the cavity of the tympanum, rupture of the membrana tympani, and disarticulation of the ossicula, but by causing destruction of the membranes of the fenestra ovalis and fenestra rotunda, (or inner drum,) and allowing the fluids of the internal ear to escape, whereby impairment of the functions of the auditory nerve is produced. The total number of the completely deaf and dumb in this class is 143, the female sex preponderating in

the proportion of 84 to 59 males;—there are only three persons dumb only.

In the second section are included those diseases and accidents which affect the ear through the brain and nervous system. Of this class, the cases which amount to 304, exclusive of 79 instances of persons dumb only, the most numerous have been—from fever, 103; paralysis, 46; fright, 39; and falls affecting the brain and spinal marrow, 35. A careful analysis of a kindred table having been given in The Status of Disease for 1851, it is here unnecessary to enter more at length into the description of the diseases and accidents which have produced muteism through the nervous system. It is worthy of note that, although the amounts given in the various sections of this table vary considerably from those afforded by the returns for 1851, yet the relative proportions of diseases and accidents, and especially the proportion of sexes, retains a remarkable similarity.

Of the unclassified section, amounting to 66 deaf and dumb, and 10 dumb only, the

### TABLE XII.—Showing, by Sewes, the Causes of Acquired Muteism and

THE DEAF most frequently assigned cause was that attributed to cold and exposure, 37; next in AND DUMB. numerical order is scrofula, 14; and sleeping in the open air, 12. This latter cause, which is supposed by the Irish peasantry to be frequently productive of disease, is partially dependent upon popular superstition. Although attributed to disease or accident of some description, the immediate cause has not been specified in 158 instances: 135 of deafdumbness, and 23 in which the persons were dumb only.

Education of Dumb.

As one of the principal objects in making statistical inquiries into the diseased, the the Deaf and destitute, or the helpless, is that they may be either relieved of their infirmities, provided with suitable asylums for their cure, comfort, or safe-keeping, or be afforded the means of ministering to their own wants; the subject of the Education of the Deaf and Dumb, both in a literary and industrial point of view, was on the present, as well as on the former occasion carefully inquired into. The result of that portion of the inquiry is exhibited by Table XIII., on pages 28 and 29. It does not include those Deaf-mutes who were either idiotic, paralytic, or were by any other means rendered unsusceptible of that amount of instruction which the ordinary Deaf-mute is capable of receiving. Of the total 3,830 persons specified in this Table, 1,229 were educated, or in the proportion of 1 educated to every 3.12 ignorant; the males in the former class predominating in the proportion of 100 to 83.16 females.

It is of comparative unimportance to know the ages of educated Deaf-mutes, but it is of moment that the State, as well as those interested in the welfare of this afflicted class, should be acquainted with the ages of those who are still in a state of ignorance. Of the 2,685 persons, 1,452 males and 1,233 females, who were uneducated, 215 were children under five years of age; but as many as 930 persons, 538 males and

## the Ages at which the Diseases or Acoidents which produced such occurred.

392 females, were aged from five to fourteen, both inclusive, and, therefore, of the THE DEAR School-age, or that period at which, according to the most eminent authorities, this afflicted AND DUMB.

class of the community are most susceptible of education.

Compared with the investigations made in 1851, this Table shows, both absolutely and the Deaf and relatively, a great increase of education among the Deaf and Dumb. The total number Dumb. returned as educated on the former occasion being only 790, or 439 less than that returned The last column in this Table affords a means of comparing the proportion of educated to uneducated Deaf-mutes in each Province, County, and City, for the entire country. By it we perceive that in the Province of Leinster the proportion of educated to uneducated was 1 to every 1.99; in Ulster, 1 educated to every 2.8 ignorant; in Munster, 1 to 3.91; and in Connaught, 1 educated to every 6.53 uneducated; the total for Ireland being 1 to every 3.12; whereas, ten years ago, it was 1 to every 4.57. According to localities, we find that the greatest amount of ignorance among the Deaf and Dumb prevails in the Counties of Wexford, Mayo, Clare, and Galway; while in Dublin County and City, Cork City, Belfast Town and Carrickfergus, the proportion of educated to uneducated becomes a decimal. Deductions of this nature, must, however, be received with caution until all the other circumstances necessary to be taken into such calculations are known.

Having, in the Report on The Status of Disease for 1851, given a history of the Institutions institutions for the deaf and dumb, both in the British Isles and in other countries, and as for the Deaf nothing of importance has since been added to the information relating to that subject, we and Dumb. do not consider it necessary to recapitulate our former observations. In that report we also gave the history of the seven educational establishments for the deaf and dumb in Ireland

THE DEAF AND DUMB.

Institutions for the Deaf and Dumb.

which then existed, and which institutions remained unaltered, either in name or locality, at the time of taking the Census in 1861;—but the amount of accommodation therein, and the average annual receptions for the past decade have increased. The number in the Institutions at the time of taking the Census shows an increase from 232 in 1851, to 399 as afforded by the present returns, of which number 210 were males and 189 females. The only Institution for the Deaf and Dumb recorded in the following Table, which has not progressed since the date of our previous report, is the Dublin Day School for the Deaf and Dumb at the Dorset Institution, in which there was only one pupil at the time of taking the last Census.\*

<sup>\*</sup> From the answers received from the various authorities in Europe and America, to whom we applied for the information set forth in Table XVI., on pages 32 and 33, we learn that there existed the following number of schools for the Deaf and Dumb:—In France, 2 public and 44 private; Bavaria, 9; Hanover, 4; Würtemberg, 3; Hesse-Darmstadt, 2; Switzerland, 9; Austria, 15, with 741 pupils; States of America, 22, with 2,000 pupils; Saxony, 2; Holland, 3; Sweden, 1; Belgium, 5; Prussia, 25; Savoy, 1; and Russia, 2. In Italy, there are schools for the deaf and dumb at Siena, Modena, Parma, Padua, Verona, Venice, Milan, Genoa, Turin, Naples, and Rome. A State provision for the deaf and dumb exists in the States of America, France, Savoy, Austria, Russia, Belgium, Hanover, Prussia, Saxony, Bavaria, Würtemberg, Hesse-Darmstadt, Sweden; and in Canada £5,000 has lately been expended in laud in the City of Hamilton, on which it is contemplated to erect an Institution for the Deaf and Dumb.

## and Dumb, both Congenital and Acquired, in the several Provinces, Counties, Cities, and Towns in Ireland.

Table XV., given on pp. 30, 31, shows by ages and sexes, the Counties, Cities, or Towns, THE DEAD from which the pupils in the seven Educational Establishments for the Deaf and Dumb AND DUMS. were derived. By it we learn that 16 were natives of England, Scotland, and America, who had been sent to this country for instruction; and of the remaining 383, the greatest Pupils in number (compared with the actual amount of muteism in these localities), were from the Public Incounties of Kilkenny, Louth, and Down, the town of Drogheda, and the cities of Dublin stitutions. and Kilkenny; and the least from the counties of Wicklow, Monaghan, Fermanagh, Mayo, and Longford, and the cities of Cork, Belfast, and Limerick. Of the 399 pupils in these Institutions at the time of taking the Census, 108 persons—59 males and 49 females, were supported in the Institutions of St. Mary and St. Joseph, in the vicinity of Dublin, by the Guardians of their respective Unions, in accordance with the Act 6 and 7 Vic., cap. 92. These Deaf and Dumb were from 52 Unions.

In answer to our inquiry we were informed that there were no inmates of any of the other Institutions supported in whole or in part by Poor Law relief.

In bringing to a conclusion this portion of our Report upon Vital Statistics, we would again respectfully suggest, for the consideration of Her Majesty's Government, the advisableness either of engrafting upon the National System of Education, Institutions for the instruction of this afflicted class, or of granting aid from the State to those Schools

already in existence; or of rendering it compulsory upon Boards of Guardians to send for instruction to suitable Institutions, such Deaf and Dumb, or Blind persons, under the age of eighteen, as may be in their Unions, and who now come under the provisions of the Poor Law Act, 6 and 7 Vic., cap. 92, sec. 14, already referred to.

The untimely death of the late Professor O'Donovan, who reported upon the ethnology

of the Deaf and Dumb from the names submitted to him in 1851, prevents our entering on that branch of the subject upon the present occasion.\*

General

When drawing up that portion of our Report on Vital Statistics for the decennial period ending 1851, which was published under the title of The Status of Disease, we referred to

Digitized by Google

Vital Statistics.

According to the Report published in 1851, the family names of the Deaf-dumb were in the following proportion, 1,198 Irish, 352 English, and 151 Scotch. Many instances occurred in which several persons of the same name were affected.

the number of the Deaf and Dumb, and the Blind, of such countries in Europe as the printed General statistics, at that time available, enabled us to present. The information then given with respect to the number of, and the proportion to, the population of those classes in their respective countries, was altogether derived from published works, and chiefly depended upon the authority of their writers and compilers. Anxious to procure the most recent as well as authentic information upon this department of vital statistics, a letter was addressed to the chiefs of the Statistical Departments, or other persons intimately connected with the subject of vital statistics, in thirty-four countries in Europe and America, asking for information respecting the date and period of taking the Census, the amount of the population, the number of the Deaf and Dumb, the Blind, and the Lunatic and Idiotic, &c. The results of that inquiry are set forth in the accompanying Table No. XVI., which shows the ratio of these afflicted classes to the population in twenty-one countries in Europe and America.

No answers were received from the British West Indies,\* Australia (North),† or Portugal.‡ From Scotland, it was said, the returns would not be available until June, 1863. From Canada we received an answer to the effect that no further information, beyond the number of the population, was, at that time (August, 1862) available. From Austria, Spain, Switzerland, the Italian Duchies, Greece, and Russia, we learned that no inquiry had been made as to the number of the Deaf and Dumb, the Blind, or the Lunatic and Idiotic.

\* The Statistics of the West India Islands are difficult of attainment, inasmuch as they are all procured separately by the different local Governments. Mr. Hammick, Assistant Census Commissioner in England—to whom we are much indebted for the facility with which we have obtained much of the foregoing information—has been good enough to forward us the following results with respect to certain of the West India Islands:

—Antigua and Bermuda, Mutes, 1 in 395 of the population; Blind, 1 in 386. Tortola, Mutes, 1 in 864; Blind, 1 in 756. Barbadoes, Mutes, 1 in 4,127 (but on very slender data); Blind, 1 in 883; Tobago, Mutes, 1 in 963; Blind, 1 in 700. Honduras, Mutes, 1 in 534; Blind, 1 in 401. Jamaica, Mutes, 1 in 689; Blind, 1 in 358. Before, however, these statistics can be relied on, they require to be tested by an examination of the mode in which the Census from which they are derived was taken.

the last Census of South Australia was taken on the 8th April, 1861, when the population amounted to 126,830, viz., 65,048 males and 61,782 females, to which are to be added "1,170 for omissions and persons travelling," making a total population, on 8th April, of 128,000.—See Statistical Register of South Australia for 1861; and also MS. return from Captain Bagot, who states that there are no returns for Deaf-mutes or Blind in that colony, but that on the 1st January, 1861, there were 140 Lunatics and Idiots—83 males, and 57 females.

A second attempt to procure the Vital Statistics of Portugal, made through the British Consul at Lisbon,

who kindly interested himself in the matter, was equally unsuccessful.

§ The Census of Scotland is taken decennially, contemporaneously with that in England, Wales, and Ireland. According to the abstract of the population of that kingdom for the 7th April, 1861, the numbers were 3,062,294; or 1,449,848 males, and 1,612,446 females.

In Canada the Census is taken decennially—last on 14th January, 1861; population, 2,507,656; 1,279,910

males, 1,227,746 females.

Trom Austria we learn, through the kindness of Baron C. De Czoernig, of Vienna, that the Census of that country (exclusive of Lombardy) is taken every six years, and last time upon the 31st October, 1857, when the population consisted of 34,615,466; or 17,252,557 males, and 17,362,909 females (exclusive of Lombardy; the

population of which is 2,843,125).

\*\* In answer to our inquiries respecting the Statistics of Spain, the Count De Rihalda has been good enough to inform us that the Census is taken every three years; and upon the last occasion—25th December, 1860. In that for 1857 the population was found to amount to 15,464,340; consisting of 7,670,933 males, and 7,793,407 females. The Census for 1860 gives 16,000,000 as the population of Spain.

† With regard to the Census of Switzerland, M. Vogt, Director of Statistics under the Federal Government,

informs us that the Census of Switzerland is taken every ten years; and last on the 10th December, 1860, when the population was 2,510,494, viz., 1,236,363 males, and 1,274,131 females.

† Through Professor Marani, Consul for Italy in Ireland, we have received from Signor Bigi, Advocate of

Modena, the following information respecting the population, &c., of the Italian duchies, according to the most recent investigation:—Tuscany, 1,700,000, or 250 inhabitants to every square mile; Modena, 600,000, or 285 per square mile; Parma, 550,000, or 280 per square mile. The number of the Deaf and Dumb, by birth and casualty, as well as the Blind, Lunatic, and Idiotic, can only be estimated by calculation.

§§ George Finlay, esq., of Athens, has been good enough to procure for us, through Mr. Eugene Palles, Secretary to the Bureau of Public Economy, in the Ministry of the Interior, the following information respecting the Statistics of Greece:—"The Bureau D'Economic Publique, founded in 1834, and remodelled in 1861, has the charge of the Statistics. A Census was taken in 1845, 1851, 1856, and 1861. On the last occasion the population amounted to 1.096.510, or 567.334 males and 529 176 females. There are no returns made of the number lation amounted to 1,096,510, or 567,334 males, and 529,176 females. There are no returns made of the number of Mute, Blind, Lunatic, or Idiotic."

III reply to our Circular addressed to the Statistical Bureau at St. Petersburgh, we have been informed by Dr. J. Wernadsky, Councillor of State, that the Census of Russia is "not taken regularly—nearly every fifteen

the Blind, the Lunatic and Idiotic, in twenty-one Countries in Europe and America.

THE DEAP AND DUMB. General Vital

Statistics.

For the information contained in the foregoing Table, the materials for which have in every instance been authenticated by proper official authority, we beg to express our acknowledgments to Major Graham, Registrar-General of England; to Joseph Crowdy, Esq., of Newfoundland; to S. Futton, Esq., of Nova Scotia; to the published "Abstract of the Census of Prince Edward Island;" to Dr. Harvey Peet, of New York (to whom we were also much indebted for most valuable information in 1851); to M. Legoyt, Director of the Central Statistical Bureau, and Minister of Agriculture, &c., for the Vital Statistics of France and Savoy; to M. X. Heuschling, Director of the Central Statistical Commission and Ministry of the Interior of Belgium; to Dr. Baumhauer, Director of the Statistical Department of Holland; § to Dr. S. Neumann, of Berlin, for the Statistics of Prussia; to Professor Wappäus, for those of Hanover; to Herr Wesalaz, of Dresden, for the Statistics of Saxony; to Dr. F. B. Von Hermann, of Munich, State Councillor, and Director of the Statistical Department for those of Bavaria; to Dr. Varrentrapp, of Frankfort, for the Statistics of Wurtemburg, Hesse-Darmstadt, and Oldenburg; ¶ to Dr. C. N. David, of Copenhagen, State Councillor, and Director of the Statistical Department for the returns for Denmark; to Dr. T. N. Berg, Registrar-General of Sweden, for those of that country; to Dr. Olaf Richter, of Christiana, for the Vital Statistics of Norway; and to the Chief of the Statistical Bureau, Milan, for the information respecting Piedmont.

With respect to the Vital Statistics of Hanover, Professor Wappaus informs us that the Statistics of the Deaf and Dumb were not obtained simultaneously with the numbering of the population in 1859, but previously, in 1856, through the Parochial Clergy; he observes, however, that he does not think the difference of time in taking the two Censuses

years; and occupies from January till September, in European Russia, and till December in Siberia. It was last taken in 1857, when the population was 73,158,692, consisting of 36,340,114 males, and 36,818,578 females. Of these the population of Poland and Finland amounted to 6,400,995; the sexes being 3,116,387 males, and 3,284,608 females. The number of Mute, Blind, Lunatic, and Idiotic, are unknown."

The numbers returned for England and Wales, do not include those in the Islands in the British Seas, in which

localities there were 82 Deaf and Dumb, 188 Blind, and 43 Lunatics.

† In the case of Prince Edward Island, the States of America, Saxony, and the Grand Duchy of Oldenburg, the sexes of the Deaf and Dumb, the Blind, and Lunatic, were not afforded. In France and Piedmont the sexes of the Lunatics were not specified. For England, Prince Edward Island, Hanover, Bavaria, the Grand Duchy of Oldenburg, Denmark, Sweden, and Norway, the number of Idiots was not supplied; and in Prussia and Hesse-Darmstadt those of the Lunatics or Idiots were not stated.

‡ The French Census is legally considered to have been taken on a certain day, but the Mayors and Clerks by whom the population Returns are collected are allowed from the 1st April to 31st June, for collecting the information.

§ The number of the Idiotic returned from Holland—but 28—from one institution, is not included in the

foregoing table.

¶ Dr. J. E. Wappäus' in his "Allgemeine Bevölkerungsstatistik," Leipzig, 1861, Zweiter Theil, s. 136, gives the following result of his investigations with respect to the only two countries contained in his Table, for which we have not received more recent returns:—Iceland, 1855, population, 59,157; Deaf and Dumb, 65; males, 31, females, 34; or 1 in every 910 of the population; Blind, 202; males, 128, females, 74; or 1 in every 292. The German Dukedoms (Herzogthümer), population in 1855, 968,863; Deaf and Dumb, 504; males, 292, females, 212; or 1 in 1,950; and Blind, 590; males, 295, females, 295; or 1 in every 1,660 of the population.

¶ Dr. Varentrapp has also afforded us the following Statistics for the Grand Duchy of Baden, obtained by the

¶ Dr. Varrentrapp has also afforded us the following Statistics for the Grand Duchy of Baden, obtained by the Census taken on the 3rd December, 1861:—Males, 668,901; females, 700,390; total, 1,369,291. The number

of the Mute, Blind, Lunatic, and Idiotic, have not been inquired into.

THE DEAP AND DUNB.

General Vital Statistics. of sufficient moment to interfere with the calculations in the foregoing Table. From New York Dr. Peet writes, "Although the Census of the United States is taken every tenth year—in several of the States, for instance in New York, New Jersey, and Illinois—a State Census is taken for the intermediate fifth year. The last Census (for June 1st, 1860) was not taken exactly on that day, the mode of taking it, (by the Officers calling from door to door,) requiring many weeks to fill up the Schedules, but the information embodied all that was referred to in the Status on that day."

This Table (together with the foot notes), shows the periods, as well as the time of the year, at which it was deemed advisable to take the Census in twenty-seven countries. From it and the notes, we learn, that in the British Isles, Belgium, Holland, Norway, Piedmont, Switzerland, Canada, Newfoundland, Nova Scotia, and the States of America, the Census of the population is taken decennially; in Prince Edward Island, every seven years; in Austria, every six years; in France, Denmark, and Sweden, every five years; in Savoy, every four years; in Prussia, Spain, Hanover, Saxony, Bavaria, Wurtemburg, and Hesse-Darmstadt, every three years; and in Russia, about every fifteen years. The month in which the Census of these countries has been taken varies, from December in Prussia, Belgium, Holland, Spain, Sweden, Norway, Bavaria, the German States, Switzerland, and Piedmont, to January in Canada, February in Denmark, March in Nova Scotia, April in the British Isles, May in Newfoundland† and Prince Edward's Island; and from April to June in France, Savoy, and the States of America.

By an examination of this Table we learn that in a population of 144,424,107, the sexes being 71,896,750 males, and 72,527,357 females, and comprised of a great variety of races -Celts, Saxons, Normans, Anglo-Saxons, Anglo-Americans, Sclavonians, Norse, Scandinavians, Italians, French, Germans, Flemish, Dutch, Free colored races, Slaves of African origin, North American Indians, and even Lapps — the total number of Deaf and Dumb was 94,670 or in the proportion of 1 in every 1,526 of the population, and that the proportion of the sexes of this class was 78.06 females to 100 males. This ratio to the population varies from 1 in 443 in Savoy, to 1 in 2,714 in Holland. Among the questions asked of the Statistical Bureaus of Europe and America, was-one as to the relative numbers of the cases of Congenital and Acquired Muteism, but in only one instance, that of Oldenburg, were we enabled to get a satisfactory answer to this question; so that as yet ours are the only statistics on this subject available for scientific purposes. How far race, degrees of civilization, temperature, elevation, soil, or a flat or mountainous countryinfluence the production of Congenital Deaf-dumbness, irrespective of those other questions of a social nature, such as scrofula, hereditary descent, the intermarriage of relatives, &c., are questions of great interest, but scarcely suited to the nature of this Report, in which it is intended to deal with presumed facts, and accredited statements, and not to Of this, however, diverge into speculations for which as yet there are not sufficient data. we feel assured that notwithstanding all that has been published on the subject of the presumed or computed numbers of the Deaf and Dumb, the Blind, or the Lunatic. Idiotic, &c., for different countries, the most recent and reliable information is that contained in the foregoing Table.

\* The foregoing mode of taking the Census in America was that adopted in Ireland in 1821 and 1831; but its incompleteness, as well as fallaciousness, was long since discovered and has been corrected in the present, as well as in the Census for 1841 and 1851. Dr. Peet has been good enough to afford us the following results of the last American Census:—

| "Whites, | <br>284,000 | Pemales.<br>13,116,702<br>253,99 <b>6</b><br>1,971,135<br>17,188 | Total.<br>26,966,662<br>487,996<br>3,953,760<br>36,662 |
|----------|-------------|--|--|
|          | 16.086.059  | 15.359.021   | 31,445,080   |

"About 300,000 other Indians, retaining their independent tribal organizations, are not included in this Census. Of the 15,077 Deaf and Dumb the proportions were: White and Free Coloured, 14,269; Slaves, 808. This number includes many old people returned as Deaf. The Tables are to be revised, and such numbers to be excluded. The sexes are not distinguished in the Tables to be revised for the full Report of the Census. Our Census Returns make no distinction between congenital and acquired cases; the only statistics of that kind, that we have, are derived from some of the Reports of our Institutions." Dr. Peet adds that he has been informed by C. Kennedy, esq., the Superintendent of the Census at Washington, that a statement in tabular form "of every Deaf-mute, with age, sex, colour, nativity, &c., has been prepared; but it is not yet classified by either ages, sexes, or colour; it is merely a transcript from the Census of each case."

† The answer to our query, respecting the time of taking the Census in Newfoundland, was answered thus: "Summer of 1857, commencing 22nd of May," so that we must suppose the taking of the Census extended over a time longer than that recognised in the British Isles and most other countries, where the numbers of the population are presumed to be taken on a certain day.

‡ Dr. Richter states that the number of Laplanders included in the population of Norway is 15,999. They reside chiefly in the mountains and the deserts of Zinnerken, to the extreme north of the country.

#### REPORT UPON THE NUMBER AND CONDITION OF THE BLIND IN IRELAND.

Mode of

THE BLEED

Until the inquiry instituted under the Census Commissions for Great Britain and Conducting Ireland, in 1851, no authorized special investigation as to the number and condition of the Inquiry. the Blind had been made in any portion of the British Isles. As the result of that inquiry we learn that there were then as many as 7,587 blind persons in Ireland, in a population of 6,552,385, or 1 in every 864—a number and proportion which, although startling, might then be partially accounted for by the fact that "during the three years preceding December, 1851, no less than 86,959 cases of Epidemic Ophthalmia were treated in the Irish Workhouses," as a part of the great epidemic constitution affecting both vegetable and animal life through which the country was then passing; and was also in part attributable to the fact that in the exodus of the Irish people, then at its height, the Blind, as well as other afflicted classes of the community, had been left behind by the emigrants who fled away by thousands to distant lands.

In a separate column upon the Family Schedule, "Form A," we required the number of the Blind in each household, and inserted similar columns for all the other forms upon which such portions of the population as happened to be in Hospitals, Workhouses, Asylums, Gaols, &c., on the night of the 7th April, 1861, were enumerated, and in the instructions to the Enumerators, as well as upon the Householders' Schedules, we specified that "those persons are only to be returned as Blind who are totally deprived of sight," so that those persons included in the following Tables and Report are, with the exceptions of musicians or persons who have received special education for the Blind, such as were, by their infirmity, incapacitated from pursuing such occupations as those with perfect vision are capable of following.

The additions and alterations in the present Report, beyond the information afforded by that for the previous decade are as follows. The religious persuasion of all classes having on the present occasion been required in accordance with the provisions of the Irish Census Act, is tabulated for the Blind in Table II., given at page 37. of occupations has been systematically arranged in accordance with the formula adopted for the Deaf and Dumb, and in it the ages are given in greater detail than in 1851.

When the primary information respecting the Blind, was extracted from the several "Returns," a secondary inquiry was instituted upon special query sheets, asking-

1. Whether the person was born blind, or became so afterwards?

2. Whether totally or only partially deprived of sight?

3. To what cause the loss of vision was attributed? If a medical opinion on this subject could be obtained, the Enumerator was requested to obtain it.

4. Where and in what year the person became blind; and whether at home or in a

public institution?

5. At what age sight was lost?

6. Whether other members of the family, brothers or sisters, parents or grand-parents, uncles, aunts, or cousins, were or had been blind?

7. Whether the person had been educated before becoming blind, and if so, whether he or she could read and write?

8. Whether educated since, and to what extent?

9. What industrial pursuit, such as basket-making, weaving, netting, or music, they were

acquainted with?

The answers to those queries, which were given with great alacrity and apparent truthfulness, have been, where possible, tabulated, and the results given in this report. So that so far as came within the province of the Commissioners, every information it was possible to obtain has been gleaned for the use of the State, and of those benevolent persons who have of late manifested so lively an interest in the condition of the Irish Blind.

Upon the original A Forms we received a return of no less than 8,088 blind persons— 3,642 males and 4,446 females; upon, however, instituting the secondary inquiry, as stated above, we discovered that 1,209 of these—493 males and 716 females, were only partially

blind, and these we eliminated from the following Tables—(see page 48).

Table I. on the next page exhibits by sexes and in localities, the numbers of the totally Number and Blind and their proportion to the population in the different Provinces, Counties, Cities, and Distribution Towns, as well as those that were located in Workhouses in Ireland on the night of the Of the Blind. 7th of April, 1861. From it we learn that there were as many as 6,879 persons totally deprived of sight, of whom 3,149 were males, and 3,730 females, or in the proportion of 100 males to 118.45 females. Of these persons 1,393 were in the civic districts—composed of cities and towns containing 2,000 inhabitants, and upwards—in which localities most of the institutions for the Blind are situated; 4,566 persons were in the rural districts; and 920 were inmates of workhouses. Compared with the returns afforded by the Census of 1851, it appears that the number of Blind is less by 708 than on that occasion,

Number Sexes, and Ratio of the Blind.

when the number was 7,587, and the proportion to the population, 1 in 864. But in consequence of the decrease of the people during the last ten years, from 6,552,385 to 5,798,967, the absolute proportion of the Blind to the population is now somewhat greater than at the former period, being at present 1 in 843.

According to the Provincial Summaries, there were in Munster 1 Blind person in every 596; in Leinster, 1 in 872; in Ulster, 1 in 1,052; and in Connaught, 1 in 1,078. And according to the more minute territorial division into counties, cities, and certain large towns, into which the Irish Census has been usually divided, we find the proportion to the population greatest in the city of Limerick, where the number of Blind amounts to 1 in 371; the city of Waterford, 1 in 416; the city of Cork, 1 in 498; the county of Limerick, 1 in 556; and the county of Clare, 1 in 586; while it is least in the county of Antrim, viz., 1 in 1,383; in the county and suburbs of Dublin, 1 in 1,233; in the town of Belfast, 1 in 1,245; and in Mayo, 1 in 1,169. Both as a province, and throughout all the counties and cities of which it is composed, Munster has on the present occasion, as well as in 1851, afforded the largest proportion of Blind, a circumstance to be accounted for, to a certain extent, by the ravages of the Workhouse Ophthalmia not only during the famine period, but extending to 1856.

In striking these proportions the pupils in the different asylums have been distributed throughout the respective counties or cities from which they were derived.

The proportion of sexes shows a slight increase of females over males since 1851, being Sexes of the O males to 118:45 females: and offers some remarkable differences when that sub-Blind. 100 males to 118:45 females; and offers some remarkable differences when that subject is examined in detail; thus in the city of Kilkenny the proportions for the sexes are 69.23 females to 100 males; and in the county of Louth, 68.97 females to 100 males; but both these localities upon which the calculations have been made, are comparatively insignificant, being but 22 in the former, and 98 in the latter; and it is a well-established principle in vital statistics, that presuming the circumstances to be about equal, the larger the number embraced by the inquiry, the greater the amount of truth obtained.

From Table XVI. of the general statistics of the Deaf and Dumb, the Blind, Lunatic, General Idiotic, &c., of the different countries of Europe and America, given at pages 32 and 33, Statistics of and extending over the period from 1855 to 1861, we learn, that in a population of 144,424,107, spread over 21 different countries, the total number of Blind was 114,002, or 1 in every 1,267 persons. But this proportion varies from 1 in 2,489 in the States of

Ten Burn.

America, to 1 in 540 in Norway.\* Before, however, an attempt could be made to offer even a conjecture as to the causes of the greater or less amount of Blindness in these countries, we should be acquainted with the modes by which these statistics were obtained. Compared with the Deaf and Dumb, the Blind, in the entire number specified, is 19,332 in excess; the former class being only 1 in 1,526, while the Blind are 1 in 1,267. The range of the proportion of the Deaf and Dumb is, however, greater, varying from 1 in 443, to 1 in 2,714.

Religious Profession of the Blind.

In accordance with the provisions of the Act of Parliament, under which the present Irish Census was taken, inquiry was made with respect to the religions of the different classes of the community; and from the returns received, Table II., on the foregoing page, has been compiled. By it we learn, that of the entire number, 5,635 were Roman Catholics; 728 were of the Established Church; 411 were Presbyterians; 44 Methodists; 7 Independents; 5 Baptists; 47 all other persuasions (principally Christians), and 2 Jews. Dividing the two principal forms of faith in Ireland into Roman Catholics and Protestants, this Table shows that the proportions of the former is 1 in 800, and of the latter (exclusive of Jews) 1 in every 1,039.

Marriage State and Education of the Blind.

From the following Table, No. III., we learn the Education and Marriage state of the 6,879 Blind enumerated in the foregoing section of this report :—Of the total, 2,947 were educated—1,604 males, and 1,343 females, of whom 329 were in Workhouses, and the remainder in the Civic and Rural Districts, the territorial or numerical extents of which have been already defined. Compared with the state of education of the Blind in

TABLE III.—Showing, by Ages and Sexes, the State of Education and of Marriage among the Blind.

the Blind.

Education of 1851, these figures represent a very remarkable difference, for upon that occasion there were but 953 Blind persons returned as educated, the difference between the two periods being 1,994 in favour of the present. Of the 3,891 uneducated Blind, 591 persons were in Workhouses. In 41 instances, chiefly composed of mendicants and strollers, the education could not be ascertained. Of the uneducated the sexes are in the proportion of 100 males to 156.49 females, whereas in the educated of the same class the ratio of the sexes is 100 males to 83.73 females.

Marriage State of the Blind.

More than one-half of the Blind of all ages and sexes were married, viz:-3,690 to 3,179 unmarried, the sexes of the former being 1,811 males, and 1,879 females; these results correspond in a remarkable manner with those obtained in 1851, and show that the marriage state among the Blind is, compared with a similar number of the seeing population,

<sup>\*</sup> In answer to a question addressed to Dr. Richter, of Christiana, (to whom we have already referred at page 32,) with respect to the causes of the great number of Blind in Norway, he informs us, that the diseases which produce loss of vision, are in the following proportion:—cataract, 40 per cent.; amaurosis, 23; effects of violence, 13; inflammation, 13; leprosy. 7: small-pox, 4; and attributes the great amount of blindness in that country to the want of special practitioners.

above the average; the peculiar circumstances, privations, and dependency of the Blind Tax Blue inducing a tendency to that social condition.

Table IV., on pages 40 to 43, shows by ages and sexes the occupations of the Blind, either before or since the time of their affliction. In construction it differs from that

published in 1851, which was arranged alphabetically.

Without entering more particularly into all the circumstances connected with the social condition of the Blind than the object of the present statistical inquiry would warrant, we could not separate the existing, and in many instances the recently acquired occupations, of that class of the community from those in which they had been employed previous to their loss of vision. Taken together, however, the Table exhibits, in systematic arrangement, the various classes to which the Blind may properly be said to belong, and the occupations by which they are chiefly supported. It may be divided into those callings in which the Blind were originally employed, but for which they have become by their calamity incapacitated, such as pilots, jewellers, shoemakers, printers, &c.;—into those which, having been once acquired, they might still follow, although deprived of sight: for instance, mat and brush making, weaving of coarse fabrics, spinning, knitting, straw-plaiting, hive and basket making; and into occupations, which to a certain extent could be followed, even though the persons were totally deprived of sight, such as clergymen, factors, lodging-house keepers, fruit sellers, laundresses, &c. It is, however, probable that nearly all the occupations included under the head of "ministering to amusement," and consisting of musicians, were acquired after loss of sight was sustained.

By comparing the number of the Blind of each class, as set forth in this Table, with similar sections of the occupation Table for the country at large, we can arrive at some approximation as to the effect which particular trades may exercise in inducing ophthalmic

diseases and accidents.

From an analysis of the Table, we find that although the great bulk of the population of Ireland belongs to the agricultural class, the number of Blind from among the trades and occupations "ministering to clothing" and "to house accommodations," are in the ratio of 100 to 54.72 of those Ministering to Food. These are chiefly composed of farmers and agricultural labourers, whose occupations are followed in the open air, and who are not so liable to accident from their callings as quarry-men, masons, plasterers, stone-cutters, smiths, founders, or metal-turners. This class numbers 748, the sexes being in the proportion of 100 males to 13.16 females.

Under the head of Ministering to Clothing, we find 845 Blind persons, but here the disparity in the proportion of the sexes is reversed—the females being as 100 to 21.41 males. The most numerous amongst this class are the knitters and netters, 476; and in the majority of these cases this mode of livelihood was acquired after loss of sight.

Of the 27 occupations in this class, 11 are exclusively those of females.

The trades and other occupations Ministering to Lodging or the manufacture of Furniture and Machinery, &c., includes 522 persons (but also including 206 household servants), the sexes being in the proportion of 100 males to 77.55 females. The most numerous in this division, with the exception of servants, are 180 basket-makers, an occupation especially suited to the capabilities of the Blind; and which was probably in the majority of instances acquired after loss of vision.

The class of Blind persons belonging to those who Minister to Conveyance and

Travelling amounts to 30, all males, among whom were 19 sailors.

Under the head of occupations which Minister to Literature and Education, we find

27 Blind persons, of whom 9 were schoolmasters, and 3 schoolmistresses.

The infirmities of the Blind on the one hand, and a certain amount of taste, with probably an acquired compensating delicate susceptibility to sound, has specially turned the attention of the Blind to music, for we find so large a number as 507, viz., 420 males, and 87 females, arranged under the head of Ministering to Amusement, who consisted of performers on the violin, bagpipes, harp, organ, flute, and piano-forte. As many as 196 were returned as "musicians" unspecified.

Under the head of Ministering to Health, there were but 3 Blind, and under Religion, 14. Belonging to the class whose former occupations ministered to Government and Justice, we find 276, all males, of whom 261 were pensioners, chiefly from the army, and 4 soldiers, probably Blind persons who had not at the time of taking the Census received their discharge from their respective regiments. Of the same classes of persons, 394 were returned

as Blind in 1851.

We have now to state that by a return received through the Staff Officers of Pensioners in Ireland, as many as 656 persons now living in this country, have been discharged from the British Army for diseases of the eyes during the ten years included in the decade ending the 7th April, 1861—and that 33 persons of a like class have been discharged from the East Indian Service during the same period. Occupations of the Blind.

THE BLIND. Irish blind sailors retired from the Royal Navy, we have not been able to obtain any It must, however, be remarked that only a proportion of these pensioners were quite blind, and were therefore not returned to us as "totally deprived of sight;" moreover, it is well known that many men are discharged the service for defect of sight, whose length of servitude does not entitle them to a pension, or, who having only received a temporary pension, were not returned as "pensioners."

In the division for unclassified are enumerated 3,907 Blind, of whom 317 were mendicants, being 156 less of that calling than were returned in 1851. There are also in this division 2 bankers and 2 agents belonging to a new class, entitled "Banking and Agency," adopted in the general Tables of Occupations for 1861, but which we do not consider it

necessary to insert in this part of the Report on Vital Statistics.

The total number whose occupations were unspecified was 3,519, or 1,089 less than in 1851, a fact that shows, either that a greater amount of industry now exists among the Blind; that there was a greater willingness on the part of the people to afford information; or that a more careful mode of inquiry was pursued by the Census enumerators. Each of these circumstances probably assisted in procuring that result, and all this present an improved condition of the country so far as they bear on the circumstances of this investigation.

Ages of the Blind.

Table IV. also shows the ages of the Blind, and from it we learn, as stated in our former reports on this subject, that although deprived of the blessing of sight, such

Asylums and Institutions for the Blind.

Having in the Status of Disease for 1851, reported at length upon the history of each of the six asylums which then existed in Ireland, it is here unnecessary to recapitulate the circumstances relating to Simpson's Hospital, the Richmond Institution, the Molyneux Asylum, the Ulster Institution, and the asylums for the Blind at Limerick and Cork, except to remark that the Molyneux Asylum has been removed from its former locality in Peter-street,\* to a new building specially erected for the purpose in a more wholesome situation adjoining

<sup>\*</sup> Besides the new Molyneux Asylum and the handsome church recently erected, in connexion therewith, at a cost of £11,500, in one of the healthiest portions of the suburbs of Dublin, a Day School for female blind has been also established in Hatch-street, in connexion with this institution. For the first day school for the Blind, however, which was opened in Ireland, we are indebted to Miss Pettigrew, a blind lady, who opened such an institution in Marlborough-street, in the City of Dublin, for both sexes, and all denominations, and who has since supported it by means of voluntary contributions.

persons enjoy more than the ordinary duration of life. Thus, of the entire number whose THE BLIND. ages were specified, there were only 340 under fifteen years of age; from fifteen to thirty, there were 1,116; from thirty to fifty, as many as 1,579; from fifty to seventy, there were 2,310; from Blind. seventy to eighty years of age, 868, and from eighty to ninety and upwards, so many as 654. Persons of this great age are, however, liable to cataract and other "warnings" of time peculiar to their period of life. Dividing the age period in this Table into two sections, there will be found 2,656 persons, or 386 per thousand, under forty-five years of age, and 4.211 over that age, or as many as 614 per thousand; the sexes in the former being 100 males to 108.31 females, and in the latter, 100 males to 125.31 females. Now, in the population of the healthy agricultural county of Carlow the proportion of persons under forty-five is 765 per thousand, and over forty-five but 235. And in the town of Drogheda a similar calculation shows 783 per thousand under forty-five years of age, and 217 over that period; so that so far as the Irish returns elucidate this subject, they tend to prove the longevity of the Blind. At the same time it must be borne in mind, in considering the value of these calculations, that the amount of blindness, whether caused by accident or disease, increases with age.

Table V. gives an exposition of the number, locality, extent of accommodation, Asylums for means of support, and amount of inmates, at the time of taking the Census, together the Blind. with the description of literary and industrial education afforded therein, for the various asylums for the Blind in Ireland, upon which it is our province to report.

Upper Leeson-street, and that the amount of accommodation therein has been greatly increased.

Since 1851 three additional asylums for the Blind, all the result of individual exertion, and two of them largely supported by public benevolence, have been established, viz.:-The Macan Asylum, at Armagh, opened in 1854, is chiefly an institution for the maintenance, without supplying means calculated to improve the literary or industrial education of the inmates, or to render them even in part self-supporting. St. Mary's Catholic Female Asylum for Industrious Blind, under the care of the "Sisters of Charity," was opened at Portobello, in the City of Dublin, in 1858, and is supported by voluntary contributions, and sums paid for the support and education of the pauper Blind by Poor Law Unions. St. Joseph's Catholic Male Asylum for Industrious Blind, now under the management of the "Discalced Carmelites," was opened in 1859, at Glasnevin, in

THE BLIND. the vicinity of Dublin. These three increase the number of institutions from six in 1851, to nine in 1861; the amount of accommodation from 270 to 440; and the number of inmates from 131 to 357. The foregoing Table also shows the description of literary and industrial education afforded in these institutions for the Blind. inmates, 171 males and 186 females, in the nine asylums on the 7th of April, 1861, 191 persons, 71 males and 120 females, were supported by the Guardians of Poor Law Unions, viz.—Two in the Molyneux Asylum, 72 in St. Mary's Catholic Asylum, 36 in St. Joseph's Catholic Asylum, and 81 in the Cork Asylum.

The Blind in

By The Status of Disease for 1851, it appears that 995 Blind persons, 373 males and 622 Workhouses females, were located in the Workhouses of Ireland, and that of these, 209 persons under 20 years of age were uneducated. The state of education and of ignorance of the Blind in each Workhouse at the time of taking the present Census, is afforded by Table VI. on the opposite page. There were 920 Blind in Workhouses, 325 males and 595 females, or 75 less than there were ten years ago. According to this return, the proportion of Blind in Workhouses to the general total of that class in the country at large is 1 in 7.48. There were 329 educated Blind in Workhouses, the sexes being 147 males and 182 females; and 591 uneducated, viz., 178 males and 413 females. From this table we also learn that of the latter class there were as many as 79 persons, 24 males and 55 females, under 20 years of age, located in the different Workhouses at the time to which this Report refers. The greatest number of educated Blind was found as follows:-In the North and South Union Workhouses of the city of Dublin, 49; in Limerick Workhouse, 21; and in Cork, 13. Of the uneducated Blind, there were 39 in Cork Union, 26 in Kanturk, 21 in Dublin North and South, 19 in Mill-street, 18 in Tralee, 17 in Macroom, 16 in each of the Unions of Kilmallock and Waterford, and 15 in each of those of Castletown, Limerick, and Skibbereen.

Diseases and Colour of the Eyes.

In 1851, we gave at page 47 of The Status of Disease, in lieu of more definite information on the causes of Blindness, a table of the diseases registered in St. Mark's Ophthalmic Hospital, Dublin, for about ten years, and the colour of the eyes in 7,354 instances of the 11,233 cases there set forth. For the sake of comparison, and in order to carry forward from decade to decade, the same class of subjects, we now afford, from the same source, Table VII., on page 48, taken from the registry of that institution, from the 1st of March, 1853, to the 30th of September, 1862. It affords, as on the former occasion, a tabulated arrangement which, with some few exceptions, all the diseases therein enumerated may, directly or indirectly, induce loss of vision. In 16,019 out of the 22,053 instances recorded in that Table, we learn that the colour of the eyes was light,—either gray, blue, or blue-gray,—the usual characteristic of the Celtic element in our Irish population, in many of whom the bright blue eye is accompanied with dark hair and eyelashes. The number of dark coloured eyes, known as hazel and brown, amounts to 6,034. The proportion of the light to the dark coloured eyes, is as 100 to 37.67, and at the time of the former investigation, the ratio was 100 to 38.36. Viewed from an ethnological point of view, this question of the colour of the eyes affords some slender means of estimating the proportion of the races that at present occupy the Irish soil.

Secondary Inquiries.

The following is the result of the returns made to the nine queries specified on page 35, which were issued for the purpose of the secondary investigation. With respect to the first question, "whether the person was born Blind,"—the answers, although satisfactory as regards numbers, were not specific in details. In the total 6,879 cases, this question was answered in 6,341 instances, and of these, in 211, viz., 118 males, and 93 females, the loss of vision was said to be congenital; but with the exception of two instances of cataract,

the precise form of disease was unspecified.
"Whether totally or only partially deprived of sight?" The answer to this question has been already given at page 35, where it is stated that so many as 1,209 persons returned upon the original Census Forms as "totally deprived of sight," were upon a more strict, minute, and special investigation into the particular circumstances of each found to be only partially Blind. The result of this inquiry shows how necessary it is to make special investigations into the subject of Vital Statistics, and with what caution statements respecting particular classes of the community returned upon the original Census Papers for any country should be received. Had the numbers of the Blind been computed upon the original returns, without instituting a secondary inquiry, they would have amounted to 8,088, or as many as 1 in every 717 of the population, and would thus have presented a much greater proportion than that in any other country of which the Vital Statistics have been published. So also with respect to the "Deaf and Dumb," the number of that class returned on the original forms was 12;195, but upon sifting them by means

For the establishment of the Glasnevin Asylum for male Blind of the Catholic religion, the public is chiefly indebted to the late Mr. Edward Sweetman, who devoted his whole time and means to its objects.

Table VI.—Showing by Sexes the Number of the Educated; and by Ages and Sexes that of the Uneducated Blind, in the Workhouses of the various Unions in Ireland, on 7th April, 1861.

of a secondary and in many instances a tertiary inquiry, it was found that 6,542 were " Deaf THE BLIND.

only," and that of the remainder 723 were "Dumb only."

As regards the third and chief question—"To what cause the loss of vision was attributed," we have to report as follows:-

As we are not aware that any reliable or authentic statistical tables specifying the causes of Blindness have yet been published, we have laboured under the usual difficulties attending origination in attempting to classify, according to diseases, this special section

Causes of Blindness. of the community. By means of the secondary inquiry already referred to, an endeavour has been made, for the first time to obtain some knowledge of the causes to which loss of sight may be attributed; and the results thereof are given in Table VIII.. at page 50. The information upon which we have had to rely for the majority of the returns as to the Cause of Blindness having been derived from non-medical sources, and in the great majority of instances, from the opinions or surmises of the unhappy, and too frequently ignorant persons who were the subjects of the inquiry, or their friends—should of necessity, be received with caution. And when it is known that with all the aids of modern science in the hands of special practitioners, and with the assistance of delicate instruments, it is not always possible to arrive at a perfectly accurate diagnosis of the pathology of Blindness, either proximate or remote, it is manifest that any thing like distinct and minute information could not be expected from an inquiry, the answers to

which were, in most instances, received through the Constabulary or Police, from the The Blind. Masters of Workhouses, or from the non-medical officials of public institutions. More-Causes of over, Blindness is not always the result of any one disease, but often of different diseases Blindness. affecting each eye; thus, one eye may have been destroyed by accident from some mechanical or chemical injury; and subsequently, by what is termed "sympathetic inflammation," the vision of the other eye may have been lost, without any disintegration of parts, or much apparent disorganization. In such cases the cause of Blindness is properly attributed to the original and remote cause, although the pathological conditions of each eye, when the examination was made, may have been totally different. Still it is hoped that in the following analysis of the answers returned to this third query, we have approximated the truth as nearly as under the circumstances it was possible, and have opened up a field which future experience may elucidate. The results of and have opened up a field which future experience may elucidate. The results of such inquiries, when properly tabulated, afford a certain amount of information, the value to be attached to which must depend upon the manner in which it is put forward to the public; at the same time it must be allowed that inquiries of this nature, even though defective, are productive of good by familiarizing both the enumerators and the enumerated with questions connected with the social well-being of the latter; and even if the result is, for the present, inconclusive, it affords a future means of comparison, and shows the public what might be obtained if a greater amount of information existed on these topics. Lest, however, it might be supposed that more value was attached to those returns than they intrinsically possess, we have, under each head, appended a list of those synonymous and analagous diseases of the organs of sight from which the table has been compiled. Filled up as these documents were by the class of persons alluded to, and from information derived from those rather less free from the effects of ignorance and popular superstition than their seeing compeers, it required some special knowledge on the subject of the diseases of the eye, as well as an acquaintance with the habits, feelings, and popular superstitions of the lower order of Irish, to tabulate all the returns received to this third The results of this inquiry are given in Table VIII., on pages 50 and 51.

Nos. 1, 2, and 3;—Small Pox, Measles, and Scarlatina, although they do not necessarily Analysis of induce ophthalmic affections, are so frequently complicated with inflammatory diseases Table VIII. of the eyes, that these entries may be taken as either having been induced by, or having occurred contemporaneously with those maladies. Taken together, the number of blind attributed to these causes amounts to 778,—in 725 instances of which the loss of sight was

caused by small pox.

No. 4, Fever;—is, in this country, a not unfrequent cause of blindness, either from cerebral affections, or those diseases which affect the integrity or functions of the eye itself, such as amaurosis and post-febrile Ophthalmia. The amount of blindness registered under this

head is 121, viz., 44 males and 77 females.

No. 5, Ophthalmia.—Under this head are included all the cases of acute, chronic, or Ophthalmia. scrofulous inflammations, or their effects, such as granular lids; vascular cornea, (Pannus); ulcers and opacities of the cornea, styled "scums, spects, films, feathers, pearls;" also albugoes, leucomas, warts (or staphylomas), partial or total synechiæ; collapse of globe from Ophthalmitis; the results of Purulent Ophthalmia, either in infants or adults, and of a specific or non-specific nature;—as well as those cases of blindness popularly described as the result of "inflammation of the eyes; workhouse, and malignant Ophthalmia; erysipelas; disease of workhouse; sore eyes, tender eyes, itching in eyes, swelling and overflowing of water from eyes, cold in eyes, pleurisy, running from eyes, distemper in the air, foul air, infection from the neighbours, smoky cabins, blasts, a fairy blast, a beeling in the eyes, sore head, scorbutic and scurvy humour in eyes, scrofula, scrofulous sores," &c. These and similar local names, which professional men who treat the diseases of the organs of sight on a large scale, and who are also acquainted with the phraseology of the people, can understand, have been applied to the effects of Ophthalmia. In addition to these cases there have been returned a great number of blind, in whom the cause assigned was either "cold and exposure, destitution, effects of climate, serving in the army, heat of climate, sleeping in a draught, sleeping in the open air, hardship, want of clothing," &c. Cases of Corneites, as well as all external inflammations of the eyes, and their results, are intended to be included under this head.

Ophthalmia having been for such a great length of time one of our endemic diseases, and having of late years been so frequently epidemic, that no less than 199,773 cases thereof occurred in the Irish Workhouses from 1849 to 1861, we only wonder the present returns for this disease—1,962, are so few. In addition to the ordinary diseases of the organs of sight, to which the inhabitants of all countries are more or less liable, there are records of several outbreaks of epidemic Ophthalmia in Ireland during the last one hundred and sixty years.

In 1701 an epidemic Ophthalmia raged in some of the inland counties of Ireland, particularly in Westmeath, and became a subject of inquiry by Dr. Sir Thomas Molyneux.

THE BLIND. Causes of Blindness.

During the great pestilential period, which commenced in the year 1739 with the sudden and total destruction, by frost, of the potato; when epizootics and epiphitics rendered the country almost a waste, and, when it is said, three hundred thousand persons Ophthalmia, perished from pestilence and famine, Ophthalmia prevailed extensively, and especially in the spring of 1740.

In 1758 "Obstinate Inflammation of the Eyes" prevailed during the spring. The same thing occurred in 1760; and again in 1772 an epidemic Ophthalmia spread over several districts in the north of Ireland. It likewise prevailed in Dublin in 1793. In 1801 there was a remarkable potato failure, said to be the consequence of excessive dry weather, and a pestilential period ensued, during which dysentery, scarlatina, and fever carried off thousands, and Ophthalmia was said to be a very prevalent disease.

Towards the conclusion of the great Influenza of 1803, Ophthalmia prevailed to a vast extent, and is said to have been communicated to the peasantry through the Irish militia, from regiments arriving in this country from Egypt. Minor attacks of Ophthalmia prevailed extensively in the Charter Schools which then existed in different parts of the In 1809 Ophthalmia prevailed among children and young persons in summer, and was again partially epidemic among the military in 1811. The year 1826 marked the commencement of another epidemic epoch, when fever, dysentery, and other pestilential diseases prevailed after the great potato failure, which followed a season of extreme heat and drought. An epidemic of post-febrile Ophthalmia then ensued. In 1840, shortly after the Dublin Union Workhouses were opened, an epidemic of Ophthalmia,—

attributed to over-crowding,—prevailed among the children during summer and autumn. The years 1844 and 1845 marked the commencement of that great "epidemic constitution," during which both vegetable and animal life throughout Europe and America suffered so severely, and in which the order of events was as follows:—epizootics, epiphitics, epidemics, and finally, all these contemporaneously for several consecutive Epidemic Ophthalmia broke out among the paupers in the Athlone Union Workhouse in April, 1848, cases being at the same time observed in the surrounding country parts, and in the town of Athlone. This was the first indication of that widespread inflammation of the eyes which formed a portion of the great "Epidemic Constitution," so marked in Ireland by the failure of the potato from 1845 to 1852. Not only were the suffering peasantry exposed to all the vicissitudes of the weather in their own wretched dwellings, and also the crowded masses of pauper children in workhouses and auxiliary workhouses, the recipients of this peculiar influence, but regiments of healthy and well-fed soldiers became affected upon visiting those localities where the disease already existed.

In 1849 epidemic Ophthalmia prevailed to a large extent in most of the workhouses in the south and west, but more particularly in the Unions of Limerick, Macroom, Tipperary, Athlone, and Loughrea. It also existed to a considerable extent in the rural

of Blindness, and the Ages at which it occurred.

districts outside the workhouses in these localities, and spread through some of the large The Blind. towns. In the workhouses alone 13,812 persons were treated for Ophthalmia in that Causes of

year; and in 1850 not less than 27,200 cases occurred in these institutions.

Blindness.

The epidemic continued to spread to the year 1851, and was particularly rife in Cork Ophthalmia. The number of cases of Ophthalmia in that year rose to 45,947. Upon and its vicinity. the night of March 30, 1851, no less than 3,883 persons—1,424 males, and 2,459 femaleswere affected with it, of whom 3,465 were in the workhouses, auxiliary workhouses, and workhouse hospitals; 236 were in infirmaries, fever, and general hospitals, &c., and the remainder at their own homes. At that period the disease prevailed most in the county of Cork, where as many as 1,133, or 1 in every 497 of the population, on a particular day, were affected. In the month of June, 1851, no less than 5,224 cases occurred. As many as 45,947 cases occurred in the workhouses in that year. The age at which the greatest number of persons were then affected was from 5 to 15.

From the year 1849 to 1852, both inclusive, as many as 118,835 cases of epidemic Ophthalmia occurred in the union workhouses of Ireland alone, besides vast numbers in rural districts, as well as in the different cities and towns. The disease prevailed most during the warm weather of June, July, August, and September. Of the entire number

affected, 84,136 were under 15 years of age.

During the period from 1849 to 1852 inclusive, according to the account of the Poor Law Commissioners, who, for several years published statistical reports of this disease as it appeared in the workhouses, sight was partially injured in 1,925 cases; in 1,270 one eye was lost, and in 517 both eyes were destroyed; so that, according to this calculation, 1 in every 32 of those affected suffered more or less. The total numbers who suffered from Ophthalmia in the Irish Workhouses during the thirteen years from 1849 to 1861, both inclusive, were 199,773, or little short of two hundred thousand. Taking the summary of the months of all these years together, we find that the disease was at its maximum in July, when the average was 1,938; it continued to decrease gradually to the end of the year, when in December the average was only 692.

From the returns for "the sick," either in public institutions or at their own houses, on the night of the 7th April, 1861, received through the Census Enumerators, we learn that there were 1,307 cases of Ophthalmia, of which number 999 were in workhouses, 154 in hospitals and other public institutions, and 154 at their own homes; the entire number being 2,576 less than was returned for the night of March 30th, 1851. A return of 129 cases of other diseases of the eye not Ophthalinia—31 at their own homes, 29 in hospital,

and 69 in workhouses, has been also received.

According to the Provincial Summaries, the cases registered under Ophthalmia were 995 in Munster, 486 in Leinster, 355 in Ulster, and 126 in Connaught. Of the total, 1,962, registered under Ophthalmia and other diseases of the eye, 787 were males and 1,175 THE BLIND. females. Of these, 457 were under fifteen years of age, 324 from fifteen to twenty-five, 662 from twenty-five to fifty, and 519 over fifty.

Ophthalmia.

From the annual reports of the Poor Law Commissioners for the last ten years, the following returns of Ophthalmia have been extracted, viz., from the 1st of January, 1852, to the 31st of December, 1861:—

| Year. | Males. | Females. | Sex Un-<br>specified. | Total. | Year. | Males. | Females. | Total. | Year. | Males. | Females. | Total. |
|-------|--------|----------|-----------------------|--------|-------|--------|----------|--------|-------|--------|----------|--------|
| 1852  | 13,402 | 16,703   | 1,771                 | 31,876 | 1856  | 3,459  | 5,376    | 8,835  | 1859  | 2,301  | 3,698    | 5,999  |
| 1853  | 6,208  | 9,669    | 136                   | 16,013 | 1857  | 2,648  | 4,469    | 7,117  | 1860  | 2,048  | 3,368    | 5,416  |
| 1854  | 5,661  | 8,806    | -                     | 14,467 | 1858  | 2,344  | 3,944    | 6,288  | 1861  | 2,336  | 3,430    | 5,766  |
| 1855  | 4,011  | 7,026    | -                     | 11,037 |       |        |          |        |       |        |          |        |

From this table, it appears that there has been a gradual decrease of the epidemic from 31,876 cases, which occurred in the year 1852, to 5,416 in 1860, and we are led to the conclusion either that, although it arose and attained its maximum of intensity within three years, it took ten years to subside—or that those special conditions, by which it was propagated and maintained in our Irish workhouses, have gradually lessened.

Causes of Blindness.

No. 6. Internal Rheumatic and Specific Inflammations.—Under this head have been arranged all those cases set down to rheumatism—a most frequent cause of loss of sight from inflammation of the internal structures of the eye in this country. Syphilitic and acute glaucomic diseases of that organ; cases of gouty and strumous iritis and choroiditis, are also included in this category. The returns classed under this item in Table VIII., amount to 203, or 83 males and 120 females. Although both are inflammatory affections, the chief pathological differences between the diseases registered under No. 5 and No. 6 consist in the textures originally attacked; the term "Ophthalmia," applying to the diseases of the external, and the expression "Internal Rheumatic and Specific Inflammations" to those of the internal structures of the eye. Not many years ago both these affections were indiscriminately styled "Ophthalamies."

No. 7. Amaurosis or Gutta Serena, and Chronic Glaucoma,—are generally applied to those diseases which induce loss of special function in the retina and optic nerve or the brain, and may be popularly divided into ocular and cerebral. Modern modes of investigation, and the use of the ophthalmoscope have enabled the oculist to make a more accurate and minute subdivision of this subject; but to do so would require a skilled examination of each individual case. Under No. 7 are registered 110 cases, 62 males and 48 females.

No. 8. Diseases of the Brain and Nervous System,—have been assigned as a cause of blindness in 322 instances, 122 males and 200 females; and included such returns as—"pain in head; inflammation of brain; water on the brain; fits, apoplexy, epilepsy, paralysis; disease of spine, fright, grief, lightness of head, continual head-ache; crying, trouble of mind; suddenly," &c.

crying, trouble of mind; suddenly," &c.

No. 9. Injuries of Head and Nervous System;—from falls, blows, wounds, and "effects of a beating," are said to have produced loss of sight in 61 instances, 37 males

and 24 females.

Accidents, although not so frequent a cause of blindness in this as it is in more manufacturing countries, are in a great many instances attended with loss of sight, either to both eyes simultaneously, as by blasting in quarries, or by the destruction of one eye inducing unhealthy action in the other. For the sake of arrangement we have classed them under five varieties, viz.:—

No. 10. Accidents produced by mechanical injury,—such as penetrating wounds from sharp instruments, foreign bodies, contusions from stone-breaking, and the like,—have caused blindness in 303 instances, in which 208 were males and 95 females.

No. 11. Injuries produced by animals,—cows, horses, pigs, cocks, &c., proved destructive to sight in 28 cases, the sexes being 18 males and 10 females.

No. 12. Instances of blindness caused by chemical means, such as lime, vitriol, &c., as well as burns, amount to 40, of which number 27 were males and 13 females.

No. 13. Destruction of sight by explosions of gunpowder,—blasting in quarries, bursting of cannon and fire-arms, and injuries from percussion caps, &c., occurred in 94 instances, the sexes being 92 males and 2 females.

No. 14. Loss of vision from lightning,—or as it has been styled in some of the returns,

"by a thunder-storm," occurred in 11 cases, 9 males and 2 females.

No. 15. Accidents unspecified produced blindness in 78 cases, 52 males and 26 females. 16. Cataract or opacity of the crystalline lens;—although a disease easily recognisable by medical practitioners, is an affection more frequently misnamed by the public than any other cause of blindness—cases of opacity of the cornea, and even staphyloma, being

confounded with and indiscriminately styled, even by educated persons, "pearls or cataracts." It is the most usual cause of congenital blindness, and is often hereditary; it is also a constant result of accident, a not unusual secondary consequence of internal inflammacauses of age. Causes of age. The total number of 416 cases, attributed to Cataract in the foregoing table, may be taken as a near approximation to the truth. The sexes were 199 males and 217 females. In only 2 instances was the disease said to have existed from birth. In 63 instances the persons were said to have been under 20 years of age at the time of its occurrence; as many as 152 were from 20 to 50; and 199 over that age.

No. 17. Childbirth.—Although we do not know of any disease attendant on childbirth, which of itself produces loss of vision, still as there are many affections of the eyes which occur during the parturient, or the nursing state, and popular opinion associates them with one or other of these conditions, the 47 females which were returned as having become blind from "childbirth," "weed," "nursing," &c., have been tabulated under this head.

No. 18. Old age does not, of necessity, impair the senses, but like all other periods of life has its climacteric diseases, of which impaired vision—generally cataract—is one of constant occurrence. As the special pathological condition of the 178 cases, 70 males, and 108 females, returned under this head, has not been stated;—they have been registered as presented by the entries in the query sheets of the secondary inquiry; the ages being

from 60, and upwards.

No. 19. Under the head of "Unspecified," are included such cases as were returned as "unknown, natural causes, visitation of God, born so, thick mist over eyes, gradually," and "effects of a whirlwind;"—the latter natural phenomenon being regarded by many of the inhabitants of this, as well as many other countries, with a feeling of awe, from a superstitious belief that it marks the tracks of the "good people" or fairies. In this category are also embraced those cases of born blindness which have been attributed to "fright of mother" during pregnancy,—a cause of congenital defect to which some authorities even in the present day subscribe. In fact all those returns as to the cause of blindness which could not with reasonableness be entered under any of the foregoing heads are embraced in this entry, the number in which is 1,589, of whom 689 were males, and 900 females.

In order to approximate to the truth, as well as to test the general accuracy of the popu-  $_{
m The~Blind~in}$ lar returns of the "Cause of Blindness," a circular was addressed in June, 1862, to the Institutions. medical officers of each of the Institutions for the Blind, requesting them to afford returns of the original disease of each of the 357 inmates, the age at which it occurred, and the present state of each eye. With the exception of that addressed to the Cork Institution, this inquiry was cheerfully responded to; the following has been the result:—In 23 cases, the persons had left the Institutions at the time the inquiry was made, and no less than 16 had died between April, 1861, and June, 1862.\* In 12 of these deaths, 3 males and 9 females, the persons were from 12 to 18 years of age. Of the remaining 231, exclusive of those in the Cork Asylum, it was found that all the returns could, with few exceptions, be classed under the heads given in the foregoing Table. Thus, in 120 instances, the original disease was stated to have been inflammation of the external tunics, of which number 80 were caused by "epidemic Ophthalmia;" in 32 the primary disease was amaurosis, in 10 of which it was cerebral; 18 had become blind from small-pox, 17 from internal and specific inflammation, 13 from cataract, 13 from injuries, 7 were congenital affections, and 11 were unspecified. Of the pathological condition of each eye, we learned, that in 59 instances, the right, and in a similar number, the left eye (but not in all cases in the same person) had softened and collapsed. In 49 instances there was opacity of the cornea in the right, and in 39 in the left eye; and in the majority of both there was also adhesion of iris. In 25 cases both eyes were amaurotic; in 2 the right alone, and in Staphyloma presented in 23 instances on the right, and in 16 on 3 the left only. the left side. Cataract was present in 12 right, and in 11 left eyes; and in 8 of these cases there was also adherent pupil. Of the remaining cases, 9 were returned as having extreme presbyopia of both eyes. In 6 there were pannus and granular lids. cases the original disease of the eyes could not be ascertained. Owing to the number and variety of complications in the pathological condition of both eyes, the result of this portion of the inquiry could not, with facility, be presented in a tabular form. Among the rare and remarkable cases of the Deaf and Dumb, given at pages 24 and 25, a list of 14 persons who were both deaf, dumb, and blind, has been afforded.

With respect to the Remote Causes of Blindness, the notices given at pages 51 and 52,

<sup>•</sup> For the information respecting the cause of blindness of the inmates of Simpson's Hospital and the Richmond National Institution, we are indebted to Dr. S. L. Bigger; for the Ulster Institution, to Dr. Samuel Browne, of Belfast; for the Limerick Asylum, to Dr. Kavanagh; and for the returns of the Molyneux Asylum, St. Mary's Catholic Female Blind Asylum, and St. Joseph's Male Blind Asylum, Dublin, to Dr. Wilson, Assistant-Surgeon to St. Mark's Hospital. The return for the Macan Institution was imperfect.

Causes of Blindness.

THE BLEED, show that outbreaks of Ophthalmia have, on several occasions, formed items in those great "epidemic constitutions" that have from time to time affected mankind in this island. and were either preceded by, accompanied, or succeeded by diseases of the lower animals, and also those affecting vegetable life. The uncertain nature of the food generally used in Ireland for the last 250 years has, indirectly, by inducing famine and disease, assisted to produce ophthalmic affections.

Ophthalmia

The crowding together of multitudes of badly-fed children and young persons, in close, and granular ill-ventilated, and unsewered temporary workhouses (which the exigencies of the recent great famine and pestilential period necessitated), tended to produce an Ophthalmia of unparalleled extent, and which either by causing ulceration or sloughing of the transparent cornea induced destruction of one or both eyes, or rendered the naturally smooth polished surface of the eyelids so rough and granular, as by their incessant attrition to cause that part of the eye to become, in time, opaque, or absolutely destroyed it. wide-spread result of the great Workhouse Ophthalmia of the last fifteen years, generally known as the disease called "granular lids," and producing what is termed Pannus, is, by keeping up a state of chronic Ophthalmia, at present one of the chief causes of impaired vision and partial blindness in Ireland.

Variability and dampness of climate.

The great and sudden variability of climate, the peculiarly moist state of the Irish atmosphere, and the deficiency of evaporation from the soddened surface of the ground, appears to promote the rapid growth of that condition of the eyelids denominated "granulation," and also to produce those frequent relapses to which ophthalmic patients are The continuance of East Winds, not merely during the spring, but on many occasions far into the summer, is also a frequent cause of ophthalmic affections. To the same condition of climate may be attributed the frequency of Rheumatic Affections, which very often attack the internal structures of the eye as well as other parts.

The extreme apathy and indifference of the Irish people with regard to diseases of the eye, as well as a certain amount of uncleanliness, likewise contributes to swell the number of the Blind. And the condition of the dwellings of the lower orders in both town

and country is also a source of eye disease.

The immense emigration during the last twelve years, has, by diminishing the number of the healthy, young, and adult portion of the population, increased the ratio of the aged and decrepit, the lunatic and idiotic, the deaf and dumb, the sickly, the weak, and the Blind left in the country;—the latter class not being receivable by emigrant vessels.

Want of pitals and Asylums.

The want of sufficient accommodation in special hospitals for the care and treatment of special Hos- persons labouring under diseases of the eye, is another cause of blindness. cases (the result of the epidemic Ophthalmia) could be relieved, and the cost of their future maintenance saved to the country, if timely received into, and retained for a sufficient length of time in such institutions. Moreover, until this year the Poor Law Guardians did not possess the ability of availing themselves of the advantages of Ophthalmic Hospitals for paupers labouring under diseases of the organs of sight. Many of the returned emigrants from America and Australia labour under diseases of the eyes, as well as a large proportion of Irish soldiers discharged from the British army.

To the foregoing list of the remote causes of blindness, may be added the want of compulsory education in ophthalmic diseases in the curricula prescribed by the various licensing bodies in the British Isles \* The law makes ample provision for the education of the ignorant, the reformation of the criminal, and the maintenance and medical treatment of the temporary sick, the pauper, the lunatic, and the idiotic; and for the two latter classes, noble institutions have been erected throughout the country, and large sums of money are annually granted for their maintenance and care. But as yet no general public asylum for the pauper Blind exists in this country, where, irrespective of age, sex, or religion, those of our fellow-creatures, deprived of one of God's greatest blessings, may find shelter, sustenance, clothing, occupation, and amusement; and be afforded the means of contributing to their own support, so as eventually to assist in relieving the country of taxation, which, whether voluntary or compulsory, is now supplied for their mere maintenance.† Moreover, there is as yet no general asylum for male Blind of the Protestant religion in Ireland.

Foreign sion for the Blind.

Among the questions asked of the different foreign statisticians, the results of which have State provi- been given at pages 32 and 33, was one as to whether any State provision had been made for the maintenance or education of the Deaf and Dumb, or the Blind. In answer thereto, we have been informed that a State provision, more or less perfect, has been made for these

† In 1860, J. A. Blake, Esq., M.P. for Waterford Borough, brought the subject of the Irish Blind under the notice of the Secretary for Ireland, and also published a tract upon their condition, containing much useful information with respect to the industrial training of that class of the community.

<sup>\*</sup>Upon this subject, Dr. Mackenzie of Glasgow, one of the highest authorities on such matters in Europe addressed a memorial to the General Medical Council four years ago, but as yet no action has been taken thereon.—(See Dr. Wilde's paper on the "Condition of the Blind in Ireland," read before the Societie des Bienfaisances. in 1862.)

afflicted classes in Canada, several of the States of America, France, Russia, Spain, Austria, The Blind.

Belgium, Hanover, Holland, in the Swiss Canton of Berne, and in Bavaria, Saxony,

Sweden, Wurtemberg, Hesse Darmstadt, Baden, and Denmark.

The tabulated returns to Query 4—"Where, and in what year the person became When Blind, and whether at home or in a Public Institution?"—inform us that in 6,342 Blindness civilians and 150 soldiers, loss of sight occurred in this country; and that in 49 civilians occurred and 104 soldiers, the same calamity happened abroad. The earliest year recorded upon the returns is 1777, between which and 1781 nine cases of Blindness among persons remaining alive on the 7th April, 1861, are said to have occurred. The following are the results of this inquiry for the eight following decades:—To 1791, but 34; from that period to 1801, we have a return of 88; as many as 161 are returned for the decade ending 1811; for that ending in 1821, we have 292; for 1831, the number rises to 384; for 1841, to 718, the sexes being 325 males and 393 females; for the ten years ending in 1851 the number increased to 1,666, or 697 males and 969 females; and for the incomplete decennial period from 1852 to the time of taking the Census in April, 1861, the number of cases of Blindness extracted from the returns has been 2,721, the sexes being 1,156 males and 1,565 females. The individual year for which the greatest number was returned was 1859, when it amounted to 357, or 146 males and 211 females. In 572 instances the years in which blindness occurred has not been stated. In 646 instances, 181 males and 465 females, blindness is said to have occurred in Public Institutions; and to 5,895 persons at their own homes.

Query 5. "At what age sight was lost?"—The returns to this question are embodied Age at in Table viii., which combines the causes as well as the ages at which Blindness occurred. which sight From that we learn that of the total 6,341, of whom it was possible to obtain the particulars upon the secondary inquiry, 1,103 persons, 608 females and 495 males, had become blind under ten years of age. From ten to twenty years of age the numbers are 835, the sexes being 486 females and 349 males. From twenty to thirty there were 756; but at this age the proportion of the sexes alters, being 440 males and 316 females. From thirty to forty the numbers decrease to 677, the sexes being nearly equal. From forty to fifty the numbers again rise to 760, the females being as many as 472 and the males 288. For the age period from fifty to sixty, 777 cases were returned, the sexes being 466 females and 311 males. Between sixty and seventy it is reported that 604 cases of blindness, 352 females and 252 males, occurred. From seventy upwards the numbers were 618,

and the sexes 349 females and 269 males.

From a tabulated arrangement made of the returns to Query 6—"Whether other mem-Hereditary bers of the family had been affected with loss of sight?"—we learn that in 239 instances Blindness. of one or more Blind in a family, several of the relations, either of the foregoing or contemporaneous generations, had also been blind. It is stated that in three cases both father and mother were or had been blind; in thirty-nine the father only, and in five the father in combination with other relatives. In eighteen cases the grandfather was blind, in four instances the grandfather in combination with other relatives, and in two instances the great-grandfather was blind. In forty-four cases the mother alone was or had been blind, and in six instances in combination with other relatives. fourteen cases the grandmother was blind, and in four in combination with other relatives. The more remote or collateral branches of the family fill up the difference between the foregoing instances and the total 239 cases, in which relationship existed between the blind. In 211 of these cases there was one blind person in the family, in twenty-two there were two blind in each family, in five there were three, and in one as many as five.

From the answers to Queries 7, 8, and 9. "Whether the person had been educated before Education of becoming Blind?"—"Whether educated since?"—"And what industrial pursuits such the Blind. persons had become acquainted with?" the following results have been obtained:—As many as 2,817 persons—1,530 males and 1,287 females—were educated before becoming blind; in 41 instances the state of education before or after blindness was unspecified, and 215 persons—80 males and 135 females—had been educated since, chiefly in the Schools and Asylums for the Blind; a few, however, were instructed in the classics, modern languages, and the higher branches of education. As many as 3,891 were, as shown by

Table III., on page 38, to be still in ignorance.

In offering an analysis of the replies to the last query, we may remark that Table IV. Occupations enumerating the Occupations of the Blind, includes both those acquired before and after of the Blind. loss of vision, and was compiled both from the "A Forms" and the Query Sheets of the secondary inquiry. It is probable that the meaning of this question was not fully understood by the enumerators or explained to the blind; for it is manifest from answers to the returns, that the previous occupations before blindness had ensued were more frequently given than those by which such persons gained their livelihood. In 2,239 instances, viz., 1,130 males and 1,109 females, the replies to this question specified the occupations.

THELUNATIC AND IDIOTIC.

REPORT UPON THE NUMBER AND CONDITION OF LUNATICS AND IDIOTS IN IRELAND.

In the attempt made for the first time in 1841 to acquire a knowledge of Vital Statistics in Ireland, a critical investigation into the number and circumstances of the Lunatics, Idiots, and Epileptics was instituted; but at that time the only sources of information were the returns from such public institutions as Lunatic Asylums, Gaols, Hospitals, and those Workhouses that were then established.

Method of conducting the inquiry.

From the Tables published in 1841, we learn that in the 24 public and private Asylums then in existence, and in the various Gaols and Workhouses, there were 2,925 Lunatics, 333 Idiots, and 124 Epileptics. As those numbers were necessarily defective as regards the total amount of persons so affected, it was deemed advisable in taking the Census of 1851 to make an effort to collect, as far as possible, similar information concerning those Lunatics and Idiots who were either at large or in the custody of their friends. "Form

Table I.—Showing, by Provinces, Counties, Cities, and Towns, the Number and Sexes of Lunatics and Idiots on the 7th of April, 1861; with their

D" was constructed for this purpose, and placed in the hands of the enumerators, who were informed in the instructions, that mendicants and vagrants of these classes should be LUNATICAND described from the best local information that could be acquired; and we added, "where Lunatics or Idiots are in the custody of their friends, the inquiry necessary to fill this form Mode of should be made with the greatest delicacy." Although that was the first time that such an conducting inquiry had been instituted in this country, no difficulties were thrown in the way of the the Inquiry. enumerators, and returns were made upon these Forms, of 1,073 Lunatics, and 3,562 Idiots. A similar investigation with the like instructions has been effected for the present Census, and the results are afforded by Table I. given below, which shows the number of Lunatics and Idiots at large or in the custody of their friends or guardians, as obtained on "Form D;" and those in Asylums, Prisons, and Workhouses, derived through "Form L' both specially designed to obtain the name or initials of name, the native place, sex,

THE IDIOTIC.

at Large, or in the Custody of their Friends, or who were Confined in Public or Private Asylums in Ireland, Proportions to the Population.

THE Idiotic.

Comparison of Numbers in 1851 and 1861.

age, religion, marriage condition, education, rank, profession, or occupation, when in LUBARTO AND health, of such persons, as well as the peculiar nature and presumed cause of disease.

> A careful examination of this Table, and a comparison with that published for 1851. afford some remarkable results. The total number of Lunatics and Idiots returned to us on the two Forms already specified, is 14,098, or 4,118 more than those afforded by To account for this great actual or presumed increase in mental the inquiry in 1851. maladies during the last ten years, the following suggestions occur to us. The Returns for 1851 were probably, in part, deficient, the inquiry being then novel; and the Enumerators (including some civilians) were not so well instructed in statistical investigations as on the recent occasion. Moreover, the state of the country at that period did not offer the same facilities for the inquiry as now. The calamitous period of the late famine, pestilence, and great reverse of fortune may have induced an undue proportion of Insanity. The increase of Lunatic Asylums from thirty-three in 1851 to forty in 1861, with an addition of 1,580 inmates, affords a more enlarged field for investigation as regards this class; and as to the greater proportionable number of Lunatics and Idiots, the remark made with respect to the Deaf and Dumb and the Blind being relatively increased by the falling off of the population by as many as 753,418 persons during the past decade, is even more applicable in considering the circumstances of this class; for in the exodus of the Irish people, neither Lunatics or Imbeciles were included among the emigrants. According to our returns, the total number of Lunatics in Ireland on the 7th April, 1861, was 7,065, the sexes being in nearly equal proportions. This is an increase of 1,991 over the returns for this class in 1851.

Distribution of Lunatics.

Of these, 1,602 were at large or in the custody of friends or guardians, or 529 more than were returned in 1851. As many as 4,613 were provided with suitable support and treatment in Asylums, or 1,379 more than in 1851. In Prisons there were 273, and in Workhouses 577, being exactly the same number in the former, and 83 more in the latter class of institutions than that afforded by the Census of 1851.

In arranging Table I., the inmates of Lunatic Asylums were distributed as follows:— When the name of the county in which they were born was stated, they were tabulated for that county; but when the name of the county was unknown, the inmates of District Asylums were divided proportionately between the counties for which the asylum was established. The inmates of Private Asylums, when the birth-place was unknown, were distributed proportionably amongst the counties and cities of the country at large.

Proportion of Lunatics to Population.

Compared with the population of their respective localities, the proportion of Lunatics was one in 633 in the Province of Leinster; one in 779 in Munster; one in 964 in Ulster; and one in 1,147 in Connaught—an immunity from insanity, which, notwithstanding the great decrease of population in that province, it manifested in 1851 also. According to a more minute territorial subdivision, we find the greatest proportion of Lunatics in the Cities of Kilkenny and Limerick, and Dublin County. The counties in which there were least Lunatics compared with their population, were Mayo, Galway, Roscommon, and Cavan, the average proportion in which was one in every 1,292 of the population. There were 30 natives of Great Britain, and 12 of foreign countries in Lunatic Asylums.

For the country at large, the proportion of Lunatics is, according to the present Census returns, one in every 821 of the population, while, by the calculations made in 1851, it was only one in 1,291; but, as already stated, we believe the returns for that period were somewhat deficient. Compared with other countries in Europe and America, we learn, on referring to the Table of General Vital Statistics, furnished at pages 32 and 33, that Ireland occupies, together with Nova Scotia, Sweden, and Bavaria, a medium proportion between the high rate of Lunacy in Oldenburg, Prince Edward Island, and Denmark, the average of which countries is one in 477 of the population, and the proportion of those of Piedmont, Savoy, Holland, and Saxony, where the average ratio is one in every 1,931. In Prussia and Hesse-Darmstadt there are no statistical returns of Lunacy, but in the nineteen other countries, from which we have procured the information respecting Lunatics afforded by that Table,—with a total population of no less than 125,827,287, and embracing as great a variety of climate, geographical extent, ethnological character of race, diversity of occupation and social and moral condition, as it is at the present day possible to obtain,—we find that the number of the Insane was 121,423, or one in every 1,036 of the people of these countries that afforded returns of this class; and that the sexes were in the ratio of 100 males to 106:59 females.

The Idiotic.

Table I. shows a return of 7,033 Idiots, or 2,127 more than was presented in 1851; the sexes on the present occasion being in the ratio of 100 males to 83.10 females. There are only four of this class natives of other countries. Of the total number, 5,675 Idiots, 3,213 males and 2,462 females were either wanderers, mendicants, or under the care of their friends. In 1851 there were 3,562 Idiots or Imbeciles at large, so that there is an increased

return of as many as 2,113 of this afflicted class of the community compared with our former report. In Asylums there were only 403 Idiots on the 7th April, 1861; in LUNATICAND Prisons, but 21, and in Workhouses, 934, instead of 1,129, the amount afforded in 1851.

The proportion of Idiots to the population at large, is, according to the present Religious Census, one in 825, or almost identical with that of Lunatics; but, in examining the Profession of distribution of this class, we observe some remarkable differences, especially in the Cities Lunatics of Kilkenny, Cork, and Limerick, where, while the proportion of Lunacy is high, that of and Idiots. Idiocy is very low.

Of the twenty-one countries of which the Vital Statistics are given in Table XVI., at pages 32 and 33, only ten have afforded returns of Idiocy; in these, with a population of 84,218,301, the proportion of Idiots to the population is one in every 1,262, and ranges from one in 269 in Savoy, to one in 2,040 in Belgium.

Table II., on the following page, shows the religious professions of Lunatics and Idiots, taken together, viz.:—10,741 of the Roman Catholic faith, 2,167 of the Established Church, 1,028 Presbyterians, 61 Methodists, 4 Independents, 3 Baptists, 33 Quakers; 60 of all

other Christian persuasions, and one Jewess. In the Table for occupations of Lunatics given in the Report upon the Tables of Occupations Deaths, published by the Census Commissioners for 1841, it is said that "The difficulties of of Lunatics forming such a classification of the Insane (embracing every grade of society and mode of life which these returns presented) as were grouped together under separate heads, all

those whose habits or pursuits, trades, or manner of living, influenced purely mental or moral diseases, independent of all morbid alterations or physical change in the brain or nervous system were so numerous, that objections may be urged against any systematic arrangement that might be constructed." Notwithstanding an arrangement of occupations was made, which was considered so apposite, that in an enlarged form it was adopted with a few alterations in the Status of Disease for 1851, where, the Commissioners say-"In enumerating the occupations of the Deaf and Dumb, we only learn what amount of industrial education that afflicted class are susceptible of. In instituting a similar investigation for the Blind, some information may be gleaned with respect to the influence of occupation in the production of disease; but, in studying the circumstances which tend to the propagation of Lunacy or Idiocy, it becomes a matter of great importance to observe the influence which the various occupations and modes of life have in inducing these affections." And again—"In arranging a classification of such occupations as might in some measure have conduced to the propagation of mental disease, difficulties arise which do not occur in drawing up a classification of the general occupations of the community, where several modes of life are grouped together, not as they affect the physical or moral condition of the individual, but as they minister to the general wants of the people." Under these circumstances, we think it advisable to adopt the same formula in classifying the Lunatic and Idiotic returned to us upon Forms D, I, K, and E, in Asylums, Prisons, and Workhouses, and those at large, as shown by Table III. upon pages 62 to 65. With the occupations have been grouped, as upon former occasions, the presumed causes of Insanity, and these have been again divided into moral and physical, and also those, where from either of these causes, the disease was attributed to "hereditary taint or family predisposition." The returns for occupation as well as the cause of disease, are more specific, and believed to be more accurate than those afforded upon the two former occasions, when inquiries of this nature were instituted; and the fact of the returns for 6,821 Lunatics and Idiots who were confined in Public Institutions, having been, for the most part, authenticated by medical opinions, has, upon the present occasion, still further rendered these tables both more voluminous and more accurate.

The only alterations made in the heading of this Table from that given for 1851 is the addition of the item for "Excitement unspecified," in the compartment showing the moral and mental causes of disease; and in that for physical causes, the addition of "Disease of heart," an affection which, by interfering with the due supply of proper blood to the brain, has (according to the returns) been assigned as a cause of mental disease; and also that

for the cases referred to the "immoderate use of tobacco." Of the ten divisions of occupations in that Table, we have to report that of Class L professional, including "gentry," male and female, and amounting to 313 (233 males and 80 females) the amount has been lessened by 91, in comparison with the returns for 1851. In this class, the moral causes were 45; the physical, 53; the hereditary, 61; and in 154 no cause was specified. Among these two former causes, 10 cases were assigned to reverse of fortune, 8 to religious excitement, 7 to study (all males), 8 to anxiety, 20 to intemperance, 12 to injuries of the nervous system, and 6 to effects of climate. The most numerous occupations in this class were—"ladies [or] gentlemen," 135; officers of the army, navy, or police, 56; clergy, 42; lawyers and attorneys, 29; landed proprietors, 23; and physicians and surgeons, 5, whereas there were 13 enumerated under this latter head ten years ago.

THE IDIOTIC.

Class II., embracing Professional with Mercantile pursuits-numbers 38, viz., 28 LUNATICAND males and 10 females; or 16 more than in 1851, when there were but 11 merchants, while the present returns enumerate 31 lunatics under this head. Reverse of fortune is the predominating assigned cause of disease in this class.

Occupations of Lunatics and Idiots.

Class III., Literary and Educational, 133, viz., 93 males and 40 females, or 33 more than in 1851, consists of 12 musicians, 52 students, and 69 teachers; among whom "study" has been assigned as the predisposing cause for 23 males and 4 females. Reverse of fortune was said to produce insanity in 10 persons, and intemperance in 7 of this class. The total mental causes in this division was 50, and the physical 16. In 61 cases the cause was unspecified.

Class IV., Shopkeepers and Traders, 168, viz., 103 males and 65 females, or 58 more than in 1851. Of these, 75 were dealers in food, and 84 shopkeepers unspecified. To moral causes were assigned 25 cases; of which reverse of fortune produced mental disease

THE

LUNATIOAND IDIOTIC.

in 12, religious excitement in 3, and grief in 4. To physical causes were assigned 21

cases, of which number in 11 the affection was attributed to intemperance.

Class V., First class Trades afforded 181 lunatics—178 males and 3 females (or 20 more than in 1851), of whom workers in wood, 77; clerks, 71; and printers and Occupations stationers, 13, were the most numerous. Under the head of moral causes are enumerated and Causes 25 of this class, of which number 10 were attributed to reverse of fortune. 32 were classed of Disease. under physical causes—19 males of whom were said to owe their affliction to intemperance; 8 cases were attributed to hereditary predisposition; and in 116 instances the cause of disease was unspecified.

Class VI., Second class Trades, 606, viz.—541 males and 65 females (or 185 more than were returned in 1851), presents 46 cases attributed to moral, 92 to physical, and 19 to hereditary causes; while in 449 instances the cause of disease has not been assigned. Among this class the most frequent causes of insanity were intemperance, 54; epilepsy, 11; injury of nervous system, 11; reverse of fortune, 10; religious excitement, 8; and terror, 6. The most numerous occupations were weavers, 137; boot and shoe makers, 83; tailors, 63; artisans unspecified, 61; smiths, fitters, and workers in metal, 45; butchers, 26; masons and bricklayers, 22; bakers and confectioners, 20; painters and glaziers, 20; coopers, 14; nailers, 12; and slaters, 11.

Class VII., Agricultural:—affords a return of 3,080 Lunatics—2,658 males and 422 females; being 1,482 more than in 1851, of the class of persons engaged in employments contingent upon agriculture or general out-door or pastoral pursuits. Of this class, farmers and farm servants comprised 3,005 of the total. To moral or mental causes were assigned 167 of these cases, including 35 attributed to grief, 35 to reverse of fortune, 32 to religious excitement, 22 to terror, 14 to anxiety, and 13 to love or jealousy. In 202 instances the disease has been attributed to physical causes, among which the most numerous were 63 to epilepsy, 56 to intemperance, 28 to disease of nervous system, 16 to fever, and 9 to effects of climate (probably cases of pensioners from the army). In 117 instances the disease is said to have been hereditary, and in 2,594 the cause of mental aberration has not been

Class VIII. includes persons whose occupations necessarily induce a considerable amount of exposure to the weather, such as coach and car drivers, sailors, constabulary, and police, &c., and amounts to 95 males,—being 13 more than those of the same class returned in 1851. In as many as 66 cases the cause of disease was not assigned, in 7 it was attributed to mental, and in 19 to physical causes. Intemperance was the most frequently recorded cause of disease in this class.

Class IX.—Special Female occupations—numbers 344, being 124 more than in 1851. Of this class the most numerous were dressmakers, 241; knitters and spinners, 64; laundresses, 20; and nuns, 11. In 261 instances the cause of disease has not been specified; in 54 it is assigned to mental, in 19 to physical causes, and in 10 to hereditary taint. The most frequent cause of mental derangement in this class was grief 18, reverse of fortune 10,

terror 8, excitement 6, love and jealousy 4, anxiety 4, intemperance 4, and epilepsy 4.

Class X.—Miscellaneous—includes such occupations and pursuits as are not embraced under any of the foregoing heads. Under it are comprehended 9,140 persons, 3,412 males and 5,728 females, or 2,278 more than were returned in 1851. Of the total, as many as 7,919 persons were returned without any specified occupation, but the greater number of whom were probably of the peasant class; 859 persons, 70 males and 789 females had been servants, 222 mendicants, 113 soldiers, and 14 factory workers. According to the reasons assigned for disease in this class 387 range under the moral, 250 under physical, and 216 under hereditary causes. Examined more minutely, this division presents the following results:—To grief were assigned 88 cases, to reverse of fortune 79, religious excitement 50, political excitement 2, excitement unspecified 6, love and jealousy 47, terror 46, study 20, passion 7, ill-treatment 8, anxiety 14,—intemperance 43, epilepsy 38, fever 27, disease of brain and nervous system 51, childbirth 34, and effects of climate 14.

From an examination of the totals afforded by Table III. we find that of the entire Moral and 14,098 Lunatics and Idiots, there were assigned to moral or mental causes 815 instances, Physical whereof 322 were males, and 493 females. Under the head of Physical causes the returns enumerate 478 males and 230 females. Only 2 cases were attributed to malformations of head. In 455 instances, 222 males and 233 females, the disease was said to be hereditary. In 12,120 cases the cause of disease has not been specified, so that the comparisons which might be made, and the deductions drawn from this Table, can only refer to 1,978

The following is the numerical order of succession as regards the cause of disease in these 1,978 cases:—intemperance, 223; reverse of fortune, 184; grief, 163; epilepsy, 122 (but this is more a result than a cause); religious excitement, 110; diseases of brain and nervous system, 104; terror, 85; love and jealousy, 74; study, 67; injury of head or spine, 63; [See page 66.]

Insanity.

ship of parents has contributed to the production of Idiocy, as well as other congenital abnormal peculiarities, both moral and physical, has not as yet been inquired into in this country; but it is a subject well worthy of investigation on a future occasion.

Of the ten other forms of Insanity or Imbecility, 5,032 persons, 2,517 males and 2,515 females, laboured under that description of disease denominated Mania; of which number 365 were said to have become deranged from moral, and 358 from physical causes; in 197 hereditary predisposition was the reason assigned; while in 4,112 the special cause for the exhibition of this phase of mental alienation was unspecified. In 278 instances the disease assumed the form of acute or ferocious mania, in 74 the suicidal; and in 29 it arose in the puerperal state, or from child-bearing.

Monomania, or that form of disease in which the mind is possessed by one special morbid idea, afforded 195 cases; Melancholia 882; Dementia, or weakness of intellect with prostration of physical power, 551, of which number 16 were cases complicated with epilepsy. There were 9 cases of Catalepsy, and 279 of uncomplicated Epilepsy. In 83

causes with the specified forms of disease, is increased in the latter respect by five additional items over that afforded in 1851, a result chiefly attributable to the increase of Lunatic Asylums, and to the fact that at present the resident officers of nearly all such public or private institutions in Ireland are members of the medical profession.

THE LUNATICAND IDIOTIC.

Classifi-

Of the 14,098 persons enumerated in it, 6,686 were Idiotic; for which number cation a presumed cause was assigned in only 49 instances, exclusive of hereditary taint, the according to form of remainder being in all probability congenital. Of these weak-minded persons 132 were disease, also epileptic. As already stated in a previous section of this report, several Idiots and Imbeciles were also either dumb or deaf and dumb. How far the too close relation-

its Presumed Cause, in 1,978 Lunatics and Idiots.

instances only the form of disease was unspecified, and of these 41 cases were attributed to moral, 15 to physical causes, and 2 to hereditary or congenital predisposition.

An examination of this table, too minute to be entered upon here, shows how far each description of disease was influenced by certain exciting causes, such as intemperance,

grief, or excitement, &c., &c.

Table V. shows by ages, sexes, and description of disease, the state of marriage and Age, Mareducation among Lunatics, Idiots, and Epileptics. In form it only differs from that riage, and presented in the Census of 1851 by the greater subdivision of diseases. From it we learn that the largest number of this class recorded under any quinquennial age-period was from 20 to 25. Of the total 14,098 in this afflicted class of the community, 2,775 persons, 1,188 males and 1,587 females, were or had been married; of whom 563 laboured under idiocy or fatuity. In 134 cases the marriage state was not ascertained.

As many as 5,519, viz., 3,000 males and 2,519 females were educated; 8,269 were uneducated; and in 310 instances there were no returns to the query under this head.

the State of Marriage and Education among Lunatics, Idiots, and Epileptics.

asylums in Ireland. All the private asylums are self-supporting, viz., by payments from patients. Of the public institutions, the Central Criminal Asylum at Dundrum, and the Lucan public Asylum, both in the County of Dublin, are supported by annual grants from the Government. The District Asylums were erected, and are supported by means

The Lunaticand Idiotic.

Public and Private Lunatic Asylums. of advances from the Treasury, repaid by Grand Jury presentments from the respective counties from which they receive patients. Some of these institutions likewise receive pay-patients. Swift's Hospital, Dublin, is of a mixed character, having private means bequeathed to it by its founder, funded property, and also partial payments from patients. All the public Asylums receive both sexes. Of the private ones two admit only males, seven only females, and twelve both males and females. The present amount of accommodation in all Lunatic Asylums in Ireland is 5,549, viz., 2,767 for males and 2,782 for females, or altogether 1,696 more than in the year 1851. The private Asylums contain accommodation for 543 patients, and the public for 5,006.

The number in all the Asylums on the 7th April, 1861, was 5,016, or 1,580, more than at the date of the previous Census. Of these, 363 persons, 187 males and 176 females, were in private Asylums. The amount of admissions during the past ten years into all these

Asylums has been 14,529, of which 1,263 were into those of a private nature.

In the Status of Disease for 1851, it was hoped "that many of those returned on 'Form D,' at their own homes, in the custody of their friends, or who were wandering through the country, shall, before an inquiry similar to the present is again undertaken, be provided for in establishments suited to their wants;"—as at that time there were only 33. Asylums for the Insane or Imbecile in Ireland, 17 public and 16 private. Several changes and many additions have taken place with respect to the former class of institutions, the circumstances attending which have been detailed in the various reports of the: Inspectors of Lunatic Asylums. The Lunatic Asylum at the House of Industry in Dublin, established in 1772, was closed, and its inmates removed to the Richmond District Asylum in 1857. The Cork Public Asylum, erected in 1787, has merged into the Cork District Lunatic Asylum, opened in 1845; and that of Kilkenny, erected in 1817, into the Kilkenny District Lunatic Asylum, opened in 1852. The Lifford public Lunatic Asylum, opened in 1802, was closed in 1861, the District Asylum at Londonderry being sufficient for the wants of that part of the country; and the inmates of the Public Asylum for. Incurable Lunatics and Epileptics, at Island Bridge, near Dublin, were removed to the Public Government Asylum, at Lucan, in 1857. Since the 31st March; 1851, District Asylums have been opened in Killarney, Omagh, Sligo, and Mullingar.

Of the private Asylums, Cheekpoint, in the County of Waterford (opened in 1827), was closed in 1857; and Finglas House, in the County of Dublin (opened in 1825) was closed in 1852; and the following have been established since 1851, viz.:—Benvere, at Churchtown, near Dublin city, in 1856; Dr. Stewart's, at Lucan, and Orchardstown: House, at Rathfarnham, County of Dublin, and St. Vincent's, at Clontarf, in the suburbs of Dublin, in 1857; Verville, also at Clontarf, in 1859; Annareagh, in the County of

Armagh, in 1860; and Highfield, suburbs of Dublin, in 1861.

Education of Idiots and Imbeciles, Having on a former occasion given at length the history of the different Lunatic Asylums in Ireland, we deem it unnecessary to repeat that portion of the subject. We would, however, again "respectfully suggest to your Excellency the propriety of taking some steps towards the education and moral improvement of Idiots and Imbeciles, a subject which at present engages the attention of the philanthropic both on the Continents and in England, where several establishments for the purpose have been erected and are supported by the State; and in which the susceptibility of this class to a certain amounts of education has been demonstrated."—See Status of Disease for 1851.

Lineatics, Idiots, and Epileptics in Workhouses. Table VII. on the opposite page, shows the number of Lunatics, Idiots, and Epileptics in the different Workhouses in Ireland at the time of taking the Census. By this we learn that there were 577 Lunatics and 934 Idiots, located in the different Workhouses of Ireland on the night of the 7th of April, 1861, as already shown by Table I. Of these two classes, the greatest number of the former were located in the Workhouses of Belfast, Cork, Drogheda, Dublin, North and South; Innishowen, Kilkenny, Limerick, Londonderry, Lurgan, Newtownards, Rathdown, and Wexford; and the greatest number of Idiots existed in the Workhouses of Athy, Banbridge, Belfast, Carlow, Clonmel, Dromore West, Dublin, South, Enniscorthy, Lisburn, Naas, New Ross, Newry, Rathdrum, and Waterford. As many as 374 Epileptics, 121 males and 253 females, neither Idiotic nor Insane, were in the Irish Workhouses at the time of taking the Census. These persons are not included in the previous tables of Lunatics and Idiots.

Lunatics, Idiots, and Epileptics in Gaols.

Table VIII., on page 72, shows the amount and distribution of the same class in the different Prisons in Ireland. From it we perceive that the Gaols, in which the greatest numbers of Lunatics and Idiots were confined, were those of Lifford, Downpatrick, Grangegorman, in the City of Dublin, Clonmel, Nenagh, and Wexford. They consist either of persons who had become insane subsequent to their committal; or of persons committed by magistrates as dangerous lunatics, or wandering idiots, &c. There were neither Lunatics, Idiots, or Epileptics in the Prisons of Cork County or City, Kerry, Kilkenny County or City, Leitrim, Longford, Meath, Sligo, Tyrone, Waterford, or Westmeath.

The number and sexes of the Lunatics and Idiots enumerated in both Tables VII. and

VIII. have been already given by Counties, Cities, &c., in Table I., pp. 56 and 57.

From a return made by W. N. Hancock, Esq., Clerk of the Custodies in the matters Lunatice and Idiots and Lunatics, we learn that there were 122 persons, 78 males and 44 females, Idiots under of weak or unsound mind under the control of the Irish Court of Chancery, and either Chancery. confined in Asylums or in the care of guardians or their friends, on the 7th April, 1861;—
of whom 14 were in England. In 1851, there were 108 of the same class, of whom 13 were in England.

# THE LAME OR DEGREPIT.

Definition of Lame or Decrepit.

Number and

distribution

of Lame or Decrepit.

### REPORT UPON THE NUMBER OF LAME OR DECREPIT IN IRELAND.

In reporting on this subject for 1851, the Commissioners say:—"Among those afflicted with permanent disease, a great number of instances will present themselves in every country, of persons labouring under lameness or deformity, either congenital or acquired, but who are not rendered incapable of following various occupations, or earning their livelihood by industrial or other pursuits. It is difficult to define with accuracy the meaning attached to the term, lame and decrepit. The results of fractures and dislocations of the extremities; the various diseases of the joints; spinal affections—loss of the perfect use of any of the limbs, from paralysis, rheumatism, sciatica, chronic arthritis, hip disease, and similar affections; as well as any of the congenital deformities to which the human subject is liable, have all been classed under this head, and are popularly defined under the terms,—'lameness,'—'a cripple,'—'humpbacked,'—'deformed,' and various other popular synonymes."—See Status of Disease, pp. 66 and 69.

Table I., on the opposite page, shows the number and distribution of this class at the time of taking the present Census. From it we learn that a return has been made of 4,120 persons, 2,156 males and 1,964 females, lame or decrepit; or 255 less than in 1851. Of these, 3,460 were located in workhouses; the sexes being 1,821 males and 1,639 females, or 401 less than were returned by those institutions ten years ago. Or the 3,460 paupers lame or decrepit in workhouses, 1,602 were under treatment in hospital. In the general and special hospitals, including lunatic asylums, there were 225 persons returned as lame or decrepit, or 80 more than in 1851. From the various prisons in Ireland, we received a return of 207 persons of this class in 1851, and in 1861 but 34. In 1851, the number of lame and decrepit returned on Form C was 162, while in 1861 those so affected amount to 401—a numerical superiority which we attribute more to greater care and accuracy in filling the returns on the present occasion, than to any absolute increase of that class in the country.

Compared with the populations of their respective counties and cities, &c., this class seems to have abounded most in the cities of Waterford, Kilkenny, and Limerick, the town of Drogheda, and the counties of King's, Wicklow, Louth, Carlow, Kilkenny, Clare, and Westmooth

Occupations of Lame or Decrepit.

The present, or previous occupations of 2,609, out of the total 4,120 persons of this class, are set forth in Table II. on pages 74 to 77. From this it appears that 1,216, either were, or had been, ministering to the production, manufacture, preparation, or sale of food; 374 of them were ministering to clothing; 754 belonged to the class whose employments minister to lodging, furniture, and machinery; 53 had occupations appertaining to transport and travelling; 40 were engaged in pursuits relating to literature and educa-

TABLE I.—Showing the Number of the Lame or Decrepit returned from the various Workhouses, Hospitals, Lunatic Asylums, and Prisons in Ireland, on the 7th of April, 1861; together with those at their own Homes, as afforded by "Form C."

THE
LAME OR
DECREPIT.

Ratio
permanently
diseased
to the

population.

The following Summary shows the ratio of each class of the permanently diseased to the population, both in 1851 and on the present occasion, so far as the returns already detailed have enabled us. By it we perceive that the proportions of the deaf and dumb, the blind, and the lame or decrepit, are nearly the same as in 1851, but that those for the insane and idiotic are vastly increased; not altogether owing to an absolute increase of these two classes of persons, but because our returns are on the present occasion more exact:—

| 18                   | 51.        | i         | 1861.                   |
|----------------------|------------|-----------|-------------------------|
| Deaf and dumb, 1 per | son in ève | ery 1,265 | 1 Person in every 1,026 |
| Blind,               | "          | 864       | " 843                   |
| Insane,              | "          | 1,291     | ,, 821                  |
| Idiotic,             | ,,,        | 1,336     | ,, 825                  |
| Lame or decrepit,    | ,,         | 1,498     | ,, 1,408                |

The proportions which the sick of these sections bear to the total of each class, are as follows:—Of the 4,794 deaf and dumb, but neither insane, idiotic, or paralytic, 1 in every 63.08; and of the 6,879 blind, 1 in every 15.46. No fair calculations could be made as regards the proportions of the lunatic, idiotic, or the lame or decrepit, who likewise laboured under temporary sickness at the time of taking the Census.

PAUPERS IN WORK-HOUSES.

Comparative numbers in Workhouses in 1851 and in 1861.

Report on the Number and Condition of Paupers in the Workhouses of Ireland on the Night of the 7th April, 1861.

At the time the Census of Ireland was taken in March, 1851, the country was still labouring under the effects of the recent calamitous period of "plague, pestilence, and famine;" and as the great mass of the pauper population, either sick or healthy, was congregated in workhouses—parent, auxiliary, or temporary—or in workhouse hospitals and temporary fever-sheds, the investigation into their circumstances held a very prominent place on that occasion. Out of a population of 6,552,385, as many as 250,611 persons,—101,402 males and 149,209 females,—were receiving in-door relief in the various institutions enumerated; of whom 42,474 were under treatment in hospital, and of these, 22,180 laboured under epidemic or contagious diseases.

On the present occasion it is our pleasing duty to report that the total number of paupers in workhouses and workhouse hospitals, on the 7th of April, 1861, was but 50,010, or 1 in every 116 of the population; while on the former occasion as many as 1 in every

26 of the entire community were in the receipt of indoor Poor Law relief.

In 1851 there were 141 parent, 11 temporary, and 356 auxiliary workhouses, besides 21 hospitals, or portions of hospitals, not attached to workhouses, in which sick paupers were located. In 1861, the number of parent workhouses was 163, and the auxiliary but 2, viz., those of the North Dublin Union, one in Church-street and the other at Glasnevin. There were no temporary workhouses; but on the night of the 7th April, 32 persons were under treatment, and paid for by their respective Unions, in certain fever hospitals;—see Table III., at page 80.

The forms issued on the present occasion were similar to those employed in 1851, and in accordance with the Census Act, the Masters of workhouses acted as Enumerators.

Table I., on the opposite page, shows by counties, cities, and towns, the population in 1851 and 1861, with the number of healthy and sick persons thereof, receiving Poor Law relief, and their proportion to the general unaided portion of the community in 1861. It differs from the table published in 1851, in having the cities or towns of Belfast, Cork, Drogheda, Dublin, Galway, Kilkenny, Limerick, and Waterford separated from their respective counties, the populations of which are now given, not according to their municipal or borough boundaries, but including those of such suburban districts as are comprised in their particular Unions, as shown on pages 79 and 80. The small county of the town of Carrickfergus is included with the county of Antrim, exclusive of Belfast. A comparison of this table with the analogous one published for 1851, shows, in a remarkable manner, the relative condition of pauperism in Ireland on the present and former occasions.

Proportion of Paupers to Population in 1851 and 1861.

In 1851, the proportion of inmates of workhouses to the population was as high as 1 in 9 in the county of Kerry, and 1 in 11 in Clare; whereas, according to the present returns it was only 1 in 85 in the latter, and 1 in 111 in the former locality. In 1861, the greatest proportion of workhouse inmates, 1 in 47, existed in the city of Kilkenny, and next to that in the city of Limerick, 1 in 48; in Tipperary county, it was 1 in 74; in Kilkenny, 1 in 79; in Limerick, 1 in 80; Waterford, 1 in 83; and Clare, 1 in 85. The least ratio of pauperism, 1 in 301, occurred in Donegal; in Down it was 1 in 238; in Tyrone, 1 in 236; Leitrim, 1 in 212; and in Monaghan, 1 in 208.

According to Provinces, we find from this Table, that in Munster there was 1 person in every 81 the recipient of Poor Law relief; 1 in 93 in Leinster; 1 in 170 in Connaught, and 1 in 190 in Ulster. In 1851, the ratio of pauperism in Connaught was greater than

that in Leinster, being 1 in 24 in the former and 1 in 33 in the latter.

-Showing, by Counties, Cities, and Towns, the Number of Inmates of Workhouses, on the night of the 7th April, 1861; -distinguishing the Healthy from the Sick; and showing the proportion of Paupers to the Population.

In the foregoing table the population is given according to the Poor Law Unions situated in each County, City, or Town, as it is obvious that the proportion of Workhouse inmates to the population should be calculated according to the district over which the Union extends.

From Table II. on the following page it will be perceived that the boundaries of Poor Boundaries Law Unions are in several instances not identical with those of the County, City, or of Poor Law Town. In 18 cases, the population is increased, and in 22 decreased. The greatest difference occurs in the Metropolis, which is caused by the extra municipal extent of the North and South Dublin Unions, the former of which includes the peninsula of Howth, and the latter extends to Whitechurch, in the parish of Whitechurch, containing the populous districts of Rathmines and Rathgar, &c. Those Unions together embrace the whole of the civic and suburban population, amounting to 205 202 together whole of the civic and suburban population. whole of the civic and suburban population, amounting to 305,293, together with an additional rural population of 31,425 persons.

The other differences in the population worthy of note occurred in the Counties of Wicklow, Mayo, Meath, Louth, Westmeath, and Kerry. In the first of these are situated the Workhouses of Baltinglass, Shillelagh, and Rathdrum, portions of which Unions extend into the adjoining Counties; but the Unions of Naas and Rathdown, the Workhouses

PAUPERS IN WORK-HOUSES.

PAUPERS IN WORK-HOUSES.

Boundaries and populations of Poor Law Unions. of which are also situated in adjoining Counties, extend into the County of Wicklow, and take from it 1,862 persons more than it gained by Baltinglass and Shillelagh.

In the County of Kerry all the Poor Law Unions are within the boundary of the County, except that of Glin, the Workhouse of which is in the County Limerick. The portion of Glin Union within the County of Kerry has a population of 4,714 persons, which has been included with the County of Limerick.

The following TABLE, No. II., shows the difference in the population thus arranged:—

Sexes of Paupers.

The sexes of persons in workhouses were 20,089 males and 29,921 females, or in the proportion of 67:13 males to 100 females. The greatest disproportion of sexes was to be found in the counties of Meath, Galway, Clare, King's, Kilkenny, and Monaghan.

At the time of taking the Census of 1851, there were 3,653 persons receiving out-door

relief; in 1861, the number was 4,628.

The total amount of workhouse accommodation on 30th March, 1851, was 308,845. By a recent return from the Poor Law Commissioners it was 161,584, on the 7th April, 1861.

In 1851, the number of sick paupers in Hospital was 42,474, or in the ratio of 1 in 5.9 for the entire kingdom; in 1861, it was 16,730, or 1 in 3—a fact which may be explained by supposing that a greater number of workhouse inmates have now sought relief in these institutions, because of infirmity and broken health rather than on account of destitution. The least proportion of temporary sickness existed in the workhouses of Wicklow, Drogheda, and Londonderry; and the greatest in those of the metropolis, Belfast, Westmeath, Clare, Cork City, Roscommon, and Sligo.

Of the foregoing 16,730 sick paupers, 32 were under treatment for fever or other epidemic diseases, in the following hospitals, not attached to workhouses. In 1851, the

number similarly situated was as many as 890.

Table III.—Showing the Number and Locality of the different Fever Hospitals which afforded Poor Law Accommodation on the night of the 7th of April, 1861.

| Localities.  | Name of Hospital.   |                       | of Pauper<br>h April, 18 |                                   |

If, however, the number of those labouring under permanent disease in workhouses, but not under treatment in hospitals—such as the deaf and dumb, the blind, lunatic, idiotic, epileptic, and the lame or decrepit, amounting in all to 3,477—be added, it will increase the proportion of the sick to the entire inmates of workhouses to 1 in 2.47, which, according to a similar calculation in the returns of 1851, was 1 in 5.37. See page 99 of this Report for the further elucidation of this subject.

The following Table shows, by Unions, the details of Table I.:-

Proportion of Sick to Inmates of Workhouses.

Paupers in Fever Hospitals.

Table IV.—Showing the Number of Workhouse Inmates in each Poor Law Union in Ireland on the night of the 7th of April, 1861,—distinguishing the Healthy from the Sick; and giving the Proportion of Paupers to the Population.

\* Exclusive of 403 persons at sea on Census night.

The amount of pauperism varied considerably in the different Counties and Unions. The following are six of the best, contrasted with six of the worst circumstanced Counties or Cities; of the former, five were in Ulster and one in Connaught; and of the latter, four were in Munster and two in Leinster. Compared with a similar table for 1851, we find Proportion that at that time the amount of pauperism in the best circumstanced County or City of Pauperism was 1 in 193, and in the worst 1 in 9:-

|              |       |   |   |                                      |                  |   |   |   |   |     |      |                          |

In 1851 the best-circumstanced Union in Ireland had 1 person in every 200 of the population receiving in-door Poor Law relief, and in 1861 but 1 in 423. The only Unions in this class which appear on both tables are those of Dunfanaghy, Magherafelt, Glenties, and Banbridge. In 1851 the greatest amount of pauperism in any Union was 1 in 7, and on the present occasion but: 1 in 36.

In 1851 the Unions of Dingle, Kenmare, and Millstreet, exhibited an amount of purperism as high as 1 in 7 in each; and by the present inquiry it was only 1 in 72 in the two former, and 1 in 52 in the last.

PAUPERS
IN WORKHOUSES.
Religious
Persuasions.

The religious profession of all the persons receiving in-door Poor Law relief on the 7th April, 1861, is shown in Table V.; from which we learn that 43,473 were of the Roman Catholic faith, 4,579 were of the Church of England, 1,937 were Presbyterians, 17 Methodists, and 4 of other Christian persuasions. Taking the four latter together, it shows that 6,537 were Protestants, or in the proportion of 15.04 to 100 Roman Catholics.

TABLE V.—Showing the Religious Professions of the Inmates of the Workhouses.

Ages, Education, and Marriage State.

The ages, education, and marriage state of the 50,010 paupers in workhouses are shown by the following table. From this we learn that 6,657 were children under 5 years of age; and 5,092 were from 5 to 10. Between the ages of 10 and 20 there were as many as 8,924; from 20 to 30 there were 7,311; from the latter age to under 40, the number of paupers in workhouses was 4,512; from 40 to 50 it amounted to 3,880; from 50 to 60 it was 3,309, and between 60 and 70, 5,055. 5,208 paupers were over 70, of whom 209 were 90 and upwards.

The state of education is given more minutely in this than in any similar table in this Report. Of the whole number 21,805 were educated, and 28,205 uneducated; and of the former 9,359 could "read only," and 12,446 could "read and write." For further details relating to this subject, see the Census Report on Ages and Education.

TABLE VI.—Showing by Ages and Sexes the State of Education and of Marriage among the Inmates of Workhouses.

PAUPERS IN WORK-HOUSES.

|                | 12,   | 146   | 9,3  | 159  | 28   | ,205  | 14,          | 038   | 35   | ,972   | 50,  | 010   |   |

As many as 35,972 persons—14,467 males and 21,505 females—were unmarried; and 14,038 were or had been married.

Table VII., on the eight following pages, shows the occupations which 26,597 out of the Occupations. 50,010 inmates of workhouses, followed previous to entering those institutions, or upon

which they were engaged while residing therein.

From this Table we learn that 2,560—1,712 males and 848 females—of the occupants of Workhouses, at the time of taking the Census, had, previous or subsequent to their admission, been ministering to Food; and among these 1,507 were farm-labourers and servants, 385 had been farmers or landed proprietors, 110 were fishermen, 104 bakers, 85 herds or drovers, 59 gardeners, 43 butchers, 42 dairy keepers, 29 ploughmen, 23 millers, and 19 cooks.

The numbers ministering to Clothing amount to 3,176—the sexes being 1,487 males and 1,689 females—of whom the most numerous class was milliners, dressmakers, and seamstresses, 608; then weavers, both those of linen and the unspecified section of that class, 587-414 males and 173 females. After these come, in numerical order, the shoe and brogue makers, and shoe binders, amounting altogether to 537 persons—488 males and 49 females. The next most numerous of this class of Workhouse occupants is tailors, 330; and then in succession after these come factory workers, 160; sewed muslin and tambour workers, 139; and washerwomen, 135.

Among those ministering to Lodging, Furniture, and Machinery, amounting to 10,843 persons—1,333 males and 9,510 females, the most numerous were domestic servants, the total of which class was as many as 10,055, viz., 567 males and 9,488 females, being the largest number of any one specified occupation returned from the Irish Workhouses in 1861. It is to be deplored that some provision or asylum, suited to the infirmity and declining years of this respectable and trustworthy class of the community, does not exist. Next to servants, carpenters, 119, are the most numerous. After these come in exist. Next to servants, carpenters, 119, are the most numerous. After these come in succession masons and bricklayers, 93; blacksmiths, 88; nailers, 66; house painters. 65; coopers, 61; sawyers, 47; cabinet makers, 32; plasterers, 23; and basket makers, 20.

There were 255 persons in the Irish Workhouses on the 7th of April, 1861, who had been ministering to Conveyance and Travelling, the most numerous among whom were

sailors or boatmen, 113; coach or carmen, 48; and car owners, 18.

Two persons had ministered to Banking or Agency, prior to their becoming inmates of Workhouses, and 246 had occupations connected with Literature and Education, of which number 108 were returned as teachers unspecified, 11 had been governesses, and 96 writing clerks. Four had ministered to Religion, 7 to Charity, and 23 to Health, of which latter number 10 were midwives.

Under the head of ministering to Justice and Government, we have received a return of 196 persons, of whom 163 had been soldiers and 13 either in the constabulary or police. Thir-ty-eight had ministered to Amusement, the most of whom were musicians; and 2 had been opticians and 2 engravers, an occupation which comes under the head of Science and Art.

TABLE VII .- Showing, by Ages and Sexes, the

PAUPERS IN WORK-HOUSES.

Occupations.

As many as 32,656 persons—14,839 males and 17,817 females—belonged to the unclassified section of the community; and of these 5,310 were labourers, unspecified—4,578 males and 732 females; 3,072 persons—575 males and 2,497 females—were beggars; 484 had been dealers unspecified; 206 were prostitutes; and of 23,415 inmates of Workhouses, at the time of taking the Census, the occupations, if any, were not specified in the returns.

The Sick in Workhouses. Of the 50,010 pauper inmates of Workhouses at the time of taking the Census, 16,761 were under medical treatment in Workhouse Hospitals, including the 32 paupers in special Fever Hospitals, as already stated at page 80. This total shows a proportion of 1 sick in every 3 of the entire pauper population of these institutions.

Table VIII., on pages 94 to 97, exhibits by ages and sexes a classified return of the diseases under which these 16,761 persons laboured; and in its arrangements it is similar to that issued in the Census of 1851, as although some trivial nosological changes, and alterations of names may have been adopted by Medical Statists since that period, we deem it advisable in most instances to follow, for the sake of comparison, the formula adopted in the publications of the previous decade.

Sexes and Ages of Sick. The sexes of these sick paupers divide into 7,101 males and 9,660 females, or in the proportion of 100 of the latter to 73.51 of the former; and in 1851 it was 100 females to 84.05 males.

The ages of paupers under treatment are given in this Table, for those under 1 year old; in quinquennial periods from 1 to 20 years; and in ten-year periods from that to 80 and upwards. In 1851, the ten-year periods which presented the greatest number of sick were from 1 to 10, and from 10 to 20; and in 1861, they were from 1 to 10, and from 60 to 70.

In proceeding to analyze this table of the 16,761 persons in Workhouse Hospitals, we must remark, as was done in 1851, that a certain number of them were placed in Hospital, and under medical treatment, during the parturient period, or while child-bearing, and also on account of such trivial affections as itch, psoriasis, scald-head, chilblains, whitlow, and

Occupations of the Inmates of Workhouses—continued.

other skin diseases, for which, if not under the discipline of a Workhouse, they would not have sought indoor medical relief, and would not, in most instances, have been prevented from following their ordinary industrial occupations or educational pursuits; but being so circumstanced, they were placed in Hospital to relieve them of such maladies. The numbers The Sick so situated may be about 1,176, including 202 women in childbed. This number, together in Workwith 2,764 persons returned from Workhouse Hospitals as labouring under the effects of houses. "Infirmity, debility, or old age," of whom 1,774 were 60 and upwards, present a sum of 3,940 to be subtracted from the total, and thus leave but 12,821 patients who of necessity should be afforded indoor medical relief, or 1 in 3.90 of the total Workhouse inmates—a state of health upon the whole creditable to these institutions, having regard to the class of poor persons of which they are composed.

"This table affords at a glance a much more faithful chart of the ordinary diseases of the lower orders than that which could be afforded by any general Hospital return; because in the latter the cases are to a certain extent chosen, either on account of their intensity, the interest employed to gain them admission, or for the purpose of clinical instruction."

Having in the Status of Disease for 1851, from which the foregoing extract is taken, fully reported on the analysis of a similar table, it now only remains to institute a comparison between it and that afforded by the present returns on the same subject.

In 1851, the number of persons who laboured under epidemic, endemic, or contagious Epidemic diseases, was 22,180, or 1 in 1.91 of the total sick, and 1 in 11.30 of all the inmates of Diseases. Workhouses—the sexes of this class being in the proportion of 100 females to 78.65 males. According to the present returns, the numbers in this class are only 3,388, or 1 in every 4.95 of the entire sick, and 1 in 14.76 of the total inmates of Workhouses—the sexes being in the ratio of 100 females to 62.42 males. In 1851 the most prevalent disease of this class Fever. was Fever, under which as many as 7,888 persons laboured, or 1 in 2.81 of the total of those affected with epidemic diseases. On the present occasion, the number affected with fever was but 862, or 1 in 3.93—the sexes being 100 females to 67.05 males.

Ophthalmia.

The most numerous of the class of Hospital inmates labouring under epidemic diseases, were those affected with ophthalmia—amounting to 999, of whom 657 were females and 342 males. In 1851, the Workhouse patients returned under this head were as many as 3,465.—See remarks on this disease in the Report upon the Blind at page 51.

Dysertery and Diarrhœa. Dysentery and diarrhea, with which 8,278 patients in Workhouse Hospitals were affected on the 30th March, 1851, had decreased to 661 cases—210 of the former and 451 of the latter disease,—on the 7th April, 1861; the sexes of both together being 372 females and 289 males.

Workhouse Hospitals of Ireland, on the Night of the 7th of April, 1861—continued.

Of small-pox there were only 22 cases on the recent, and as many as 516 at the time of the Small-pox previous inquiry; and the number of instances of measles had fallen from 457, in 1851, to and Measles. 185, in 1861. Cases of syphilis had decreased from 542 to 210, viz., 146 females and 64 Syphilis. males; and so in like proportion throughout most of the remaining diseases of the zymotic, endemic, or contagious class. Ague, however (of which there was a return of 38 cases in Ague. 1851), was still as high as 14. Pemphigus, a disease once so prevalent and fatal in Ireland Pemphigus. (where it has been known under the name of "The mortifying hive,") and of which 4 cases were recorded in 1851, has altogether disappeared from the present returns.

PAUPERS IN WORK-HOUSES.

Diseases of the nervous system.

Lunacy, Idiocy, and Epilepsy.

The classified returns for patients labouring under diseases of the brain, nervous system, and organs of sense, have afforded a total of as many as 1,705—the sexes being 978 females and 727 males; with the exception of the classes of the diseases of the circulating. the urinary, and the generative organs, this is the only section of the table which presents an apparent increase over that given in 1851, when the returns for diseases of the nervous system were but 1,293. In the table of sick in Workhouses then published, the epileptics not in Hospital, and amounting to 652, were given separately by Unions.—See Table V., page 86, of The Status of Disease. A similar table for Workhouse epileptics is given in our Report on Lunatics, Idiots, and Epileptics, at page 71 of this volume. According to the original Return made on Form E, for the sick in Workhouse hospitals, 372 epileptic, and 208 idiotic persons were returned as under treatment for these maladies on the night of the Census inquiry; but, upon making a further investigation into the circumstances of each of these 580 cases, it was discovered that 109 of them were under treatment for other diseases of a temporary nature, more especially dysentery, diarrhœa, ophthalmia, &c. The total number of Lunatics, Idiots, and Epileptics, in Workhouses, at the time of taking the Census, as set forth in Table VII., on page 71, was 1,885: and of these, 292 males and 557 females, in all 849, were returned as under treatment in hospital for these maladies on the night of the 7th of April, 1861. The surplus of these cases of permanent disease not in Hospital, but in the receipt of indoor Poor Law relief, and amounting to 1,006, largely contributes, with the 1,858 lame and decrepit not in Hospital, and the 136 Deaf Mutes and 548 Blind, to increase the ratio of sickness in the Irish Workhouses at the time of taking the last Census.

Paralysis.

Blindness.

Muteism.

Diseases of Circulating Organs.

Diseases of Respiratory Organs.

Diseases of Digestive Organs.

Urinary Diseases. The most numerous item in the class of diseases of the nervous system is that for Paralysis, under which disease as many as 562 persons—309 males and 253 females laboured; as compared with 286 returned as similarly affected in 1851. The number of persons returned in Workhouse Hospitals as labouring under "Blindness" in 1851, was 63—in 1861 it was 69 out of the 920 blind in Workhouses. Upon instituting a minute inquiry into the circumstances of each of these 69 cases, we learn that 11 were affected with Cataract; 17 had amaurosis; 2 iritis; and 39 blindness, partial or complete, unspecified. Of the total 69 blind in Workhouse Hospitals, 15 were in those of the metropolis.

Five persons were returned as "Deaf and Dumb" in Workhouse Hospitals, but for what disease they were under treatment was not specified; 26 persons laboured under disease of the ear, but of what nature was not stated. There were no returns made for tetanus, as afforded by the Census of 1851; but under the head of "Nervous Diseases unspecified," are registered 46 cases of hysteria, neuralgia, and other similar affections.

In 1851 the return of patients in Workhouse Hospitals for affections of the circulating organs,—the heart and blood vessels,—was 118; in 1861 it amounted to 146, of which number 113 were affected with heart disease.

Under the head of Lung Diseases, a return was made of 2,323 cases—1,083 males and 1,240 females; while in 1851, out of 42,474 persons in hospital, the number of this class was 3,329. The chief item in this entry, bronchitis (1,320), is 2 more than in 1851; but consumption had fallen from 905 to 323 on the occasion of the recent inquiry.

The number of persons affected with diseases of the digestive organs in 1851, was 1,605; in 1861 it was 1,046, viz., 624 females and 422 males. Of these, the most numerous returns were, for dyspepsia, 300; for marasmus, chiefly affecting children, 112; and 210 for dropsy, but of what diseases of the viscera these cases were symptomatic, we have no means of determining.

As already stated, the only class of disease returned from Workhouse Hospitals (except those of the nervous system and the circulating and generative organs) which shows an increase over the entries in the Report for 1851, is that of the urinary organs and passages. On the former occasion, cases of this nature amounted to but 61, while now they reach 101, or 67 males and 34 females. We are inclined to attribute this circumstance more to improved methods of diagnosis on the part of the Workhouse medical attendants, and also to greater care in filling the returns in 1861, than to any absolute increase of urinary affections.

Affections of the generative organs, under which 270 cases were returned, were (with the exception of 6 males), confined to the female sex, and included 202 instances of women who were in the childbirth state on the night of the 7th of April, 1861. In 1851 the amount of this class was 258, of which number 192 were lying-in cases.

Including the total lame and decrepit, the entire number of persons in Workhouses labouring under acute or chronic diseases of the locomotive organs, or their permanent effects, at the time of taking the present Census, was 3,277, of whom 1,419 were under treatment in Hospital—726 females and 693 males, or 71 less than in 1851. The most numerous entry under this head was 867—468 females and 399 males—for rheumatism, a form of disease of both an acute and chronic nature to which the inhabitants of this variable

Diseases of Generative Organs.

Diseases of Locomotive Organs.

and humid climate are especially subject. At the date of the recent inquiry, the number of persons affected with rheumatism in the Workhouse Hospitals exceeded that of those returned in 1851 by 135. The cases of persons labouring under diseases of the bones and joints amounted to 183, not including 115 affected with spine disease, and 85 with Diseases of disease of the hip joint. Ninety-nine were under treatment for fractures chiefly occurring the Locomooutside the Workhouses, but which (since these institutions have become local hospitals tive Organs. as well as asylums for pauperism and destitution) were admitted for the purposes of medical treatment. Precisely the same number of cases of fracture were in the Workhouse Hospitals in 1851. There were 22 cases of dislocation, and 17 of amputation; besides 31 of "Lameness," which were not included in the general return of lame and decrepit on Form E, in these institutions.

PAUPINA IN WORK-HOUSES.

Diseases of the skin and tegumentary structures, for which a return of 6,014 cases was Tegumenafforded in 1851, had fallen to 1,838 in 1861. Of these cases, the sexes of which were tary System. 1,090 males and 748 females, the most numerous were 778 of ulceration, chiefly of the Scald head, which in 1851 afforded as many as 2,012 cases, had fallen to 248; itch, from 1,153 to 384; and pscriasis and other skin diseases, from 719 to 314. Purpura and scurvy, from the epidemic of which latter disease—as the result of the starvation period—the country was still labouring in 1851, had decreased from 105 to 37. For some observations on these affections, see The Status of Disease for 1851, page 88.

Under the head of diseases of uncertain seat, exclusive of wounds, were enumerated Diseases of 3,969 patients in Workhouse Hospitals—2,531 females and 1,438 males, or 1,496 less uncertain than in 1851. The two most numerous entries under this head, then as now, were scrofula, affording as many as 860 cases, and "infirmity, debility, and old age," 2,764; while in 1851, the former was 1,583, and the latter 3,368. The item for wounds included in this class in 1851, has on the present occasion been changed to the following class:

Of the accidents occurring in, or received into the Irish Workhouses, a return has been Accidental afforded of 236 cases, viz., 129 females and 107 males—including 107 for wounds—being Causes. 15 more than those of the same class in 1851, a fact to be accounted for by the circumstance that the Workhouse Hospitals are daily becoming more and more available for general hospital relief. The other entries in this class were, burns or scalds, 88, or 21 more than in 1851; accidents unspecified, 33; injuries of head, 6; and the effects of cold or starvation, 2. Under this last item 38 cases were returned in 1851.

In 320 instances the cause of disease or accident was not stated.

If to the 16,761 paupers under treatment in Workhouse Hospitals, be added the Deaf and Dumb, who were not in Hospital for temporary diseases, amounting to 136; the blind not in Hospital to 548; the lunatic, idiotic, and epileptic, to 1,006; and also the lame and decrepit, not returned as under treatment in Hospital, making in all 3,548 persons affected with permanent disease, it will increase the number of persons labouring under disease in the Workhouses of Ireland on a single day to 20,309, or 1 in 2.46 of the total inmates of these institutions. In 1851, a similar calculation afforded a proportion of 1 in 5.37. See also page 80 of this Report.

REPORT UPON THE NUMBER AND CONDITION OF THE SICK IN PUBLIC HOSPITALS FOR THE THE SICK IN HOSPITALS. TEMPORARY RECEPTION AND TREATMENT OF ACCIDENTS OR DISEASES.

The number, objects, locality, and early history of the various general or special hospitals of Ireland having been described at length in the Report on the Status of Disease for 1851, it is unnecessary to recapitulate here that portion of the analysis of the Vital Statistics of Public Institutions.

Table I., on the three following pages, is the analogue of one published in 1851, between Infirmaries which and it the following comparisons may be drawn:—The number of infirmaries, 36, and General in 1851, has been reduced to 35 by the closure of that at Mallow in 1852. The general Hospitals. hospitals have been increased from 15 to 19 by the addition of the Pension Medicale, opened in 1854, and the Adelaide Hospital in 1858, both in the city of Dublin; also the Mercy Hospital in the city of Cork in 1857; the old Fever Hospital at Queenstown, in the county of Cork, being turned into a General Hospital; and the establishment of the Spinning-mill Hospital at Dunbarton, in the county of Down. The hospital of the Maison de Santé

in George's-place, city of Dublin, was closed in the year 1858.

The ordinary Fever Hospitals have been reduced in number from 61 to 39, and of Fever those, 15 which were open under the provisions of the Act 6th and 7th Victoria, cap. 92, Hospitals. sec. 15, on the night of the 30th March, 1851, none existed in 1861.

The two special Hospitals, viz., the Westmoreland Lock, for syphilitic female patients, Special and St. Mark's Ophthalmic Hospital, in the metropolis, remain the same; but the amount Hospitals.

• The noble Hospital of the Mater Misericordiae, recently erected in Eccles street, in the city of Dublin, had not been opened until after the Census of 1861 was taken.

[continued on page 103.

TABLE I.—Showing, by Provinces, Counties, Cities, and Towns, the precise Locality, Name, Date of Erection, Amount of Accommodation, and Number of Patients in each of the Infirmaries, Fever, General, and Special Hospitals for the temporary reception of the Sick in Ireland, on the night of the 7th of April, 1861; with the amount of Accommodation and its proportion to the Population not otherwise provided with Indoor Medical Relief.

<sup>(\*)</sup> No information has been received regarding the amount of accommodation or the numbers admitted to the Charitable Infirmary, Jervis-street. The numbers are assumed to be the same as those returned in 1851.

(b) There are beds in the Dublin Lying-in Hospital for 100 patients, but only 50 can be conveniently received, having due regard to cleanliness and ventilation. The chronic ward for the diseases of females accommodates 12 patients.

(c) In the returns for the Hardwicke Fever Hospital, the Richmond Surgical Hospital, and the Whitworth Chronic Hospital, the saves have not been distinguished.

(d) The sexes admitted to the Fever Hospital and House of Recovery, Cork-street, have not been afforded.

(e) Sir Patrick Dun's Hospital was built for 100 patients, but only maintains 60, and 10 "pay patients."

(f) There is room in the City of Dublin Hospital, "upon stress," for 100 patients.

<sup>(</sup>a) There is accommodation for 17 children in St. Vincent's Hospital, included in the above: the 5,240 admissions under head "females," include children of both sexes.

(b) Accommodation for 22 children included in this return for the Adelaide Hospital; 875 children, of whom the sexes were unspecified, are apportised in the above number of admissions.

(l) The Whitworth Fever Hospital, Drumcondra, was closed until the year 1856; the number of admissions from that date to April, 1861, was 467.

(l) On an emergency, double this number could be accommodated in the Rathdown Fever Hospital.

(a) The Constabulary Hospital is chiefly a recovery ward, the members of the force being sent to Steevens' Hospital when sick.

(1) Kildser Infirmary could accommodate 60 patients if required.

(\*\*) Beyond the total amount of accommodation, no information could be obtained with respect to the Fever Hospital at Gowran.

<sup>(</sup>a) No record could be obtained of admissions to Mountrath Fever Hospital prior to September 27, 1834.

(b) Wexford Lying-in Hospital is supported by Lady Esmonde, Johnstown Castle.

(c) About one-fourth of the entire number admitted to the County Wicklow Infirmary were females; no separate registry was kept.

(c) If necessary, the Wicklow Fever Hospital could accommodate 60 patients. No particular number of beds allotted for either sex. Supported by grant from the county and private subscriptions.

(c) In the return for the Cork Fever Hospital, the sexes were not distinguished as regards accommodation.

<sup>(</sup>f) There was no special amount of accommodation for either sex in the County Infirmary at Mallow. It was closed in December, 1852.

(f) In the event of an epidemic, 20 males and 20 females additional could be accommodated in sustiliary abeds at the Queenstown Hospital.

(b) No return could be obtained of the numbers admitted into the Limerick Lying-in Hospital.

(l) There is no fixed amount of accommodation for either sex in the Clonnel Infirmary.

(l) Waterford General Leper Hospital is for general diseases, fractures, dislocations, &co.

<sup>(</sup>a) "The Primate's Fever Hospital," chiefly intended for tradespeople, &c., who would not avail themselves of poorhouse relief.

(b) The sexes of those admitted to the Middletown Fever Hospital have not been given; there were also the following extern cases relieved:—In 1852, 1,252 cases; in 1860, 750 cases; in 1861, 728 cases; total, 2,730 cases.

(\*) There was no record kept of the patients relieved in Rathmelton Fever Hospital.

<sup>(4)</sup> There is no record of admissions into the Fever Hospital of Dunfanaghy except for the years 1860 and 1861.

(e) The sexes of the patients admitted into the County Infirmary and Fever Hospital of Londonderry could not be ascertained. The Fever Hospital is connected with the Infirmary, and did not afford a separate return.

(f) The Fever Hospital, Rockcorry, has been closed, and converted into a dwellinghouse. No entries for the years 1852 to 1854.

THE SICK IN

HOSPITALS.

Hospitals.

accommoda-

of accommodation in the latter institution has been increased from 20 to 30 beds. A portion of the City of Dublin Hospital is also devoted to the treatment of ophthalmic diseases.

The Lying-in Hospitals, nine in number, are two less than in 1851, the Anglesey, in Dublin City, and that at Youghal, having been since closed. That at Limerick did not

afford a return on the present occasion.

The total amount of accommodation in public hospitals, exclusive of asylums and Hospital workhouses, which in 1851 was 7,972, or in the proportion of 1 to every 787 of the population, not otherwise provided with in-door medical relief of a charitable nature, has been reduced in 1861 to 6,378, being in the ratio of 1 bed to every 899 of the population so circumstanced at the time of taking the present Census. The amount of Hospital accommodation is in every instance given upon the authority of the officers of these Institutions, who, no doubt, in many instances, stated the number of beds they were capable of containing, instead of the number of patients they were at the moment able to maintain, or which the exigencies of the season or other circumstances required, and which must fluctuate from month to month. This circumstance will account for the fact of the great difference between the stated amount of accommodation and the numbers in Hospital; according to which latter it would be only 1 in 1,916.

On the 30th of March, 1851, the number of patients in Hospital was 3,839, viz., 2,153 males and 1,686 females. On the 7th of April, 1861, the numbers were 1,716 males and 1,277 females—2,993 in all, or 846 less than at the date of the former investigation. Of these, 1,536 were in infirmaries, or 212 less than in 1851; and 939 were in general hospitals, or 152 more than in 1851; and the number of patients in fever hospitals had been reduced from 1,117 in 1851, to 356 in 1861, and the amount of accommodation therein from 3,750 to 2,234, exclusive of that afforded by the fever wards of the Meath and other general Hospitals. The other public Hospitals remain the same as in 1851.

The numbers admitted into the Charitable Infirmary, Jervis-street, Dublin, have not been afforded, a portion of the registry having been destroyed; but assuming that it was not less than 5,136, the number afforded by the returns for 1851, the following would be the comparative statistics for the two periods:—the number treated in Hospitals of the foregoing classes during the imperfect decade from 1841 to 1851, was as many as 592,510 while from the 30th of March in the latter year to the 7th of April, 1861, it was only 435,596, and of these the sexes were afforded in 362,738 instances. The foot notes to Table I. point out in detail the changes which have taken place in the public hospitals of Ireland during the past decade.

From Table II. we learn the educational status of the 2,993 patients in hospital to be as follows:—1,424 were educated so far as to read and write, 612 could read only, and

957 were altogether illiterate, or 31.97 per cent. of the total.

Of these 977 persons—580 males and 397 females—were, or had been, married, and Marriage 2,016 were unmarried—1,136 males and 880 females.

condition.

TABLE II.—Showing the State of Marriage and Education among the Patients in the Infirmaries. Fever, General, and Special Hospitals in Ireland, on the Night of the 7th April, 1861.

Occupations of Patients in Public Hospitals.

THE SIGH IN in public hospitals at the time of taking the Census. From it we learn that the largest number ministering to any particular want or necessity of the community were those of the class of trades coming under the head of "Lodging, Furniture, and Machinery," under which as many as 713 persons were returned, 458 females and 255 males. Of these the most numerous were domestic servants, 558, or 450 females and 108 males. Next in numerical order are carpenters, 32; house painters, 17; stonemasons, 11; and blacksmiths, 9.

Of those ministering to food, 345, or 291 males and 54 females, the most numerous were 185 farm labourers and servants-151 males and 34 females, 81 farmers and land-

holders, 14 bakers, and 13 gardeners.

The class ministering to clothing numbering 250 persons, 133 females and 117 males affords a return of 39 seamstresses, 36 shoemakers, 36 weavers, 24 tailors and vestmakers, 18 dressmakers, 12 shoebinders, and 12 washerwomen.

The class of trades and occupations ministering to justice, members of which formed a

Table IV .— Showing, by Provinces, Counties, Cities, and Towns, the Religious Professions of the Patients in the Infirmaries, Fever, General, and Special Hospitals in Ireland.

portion of the inmates of Public Hospitals on the 7th of April, 1861, afforded a return of THE SIGE IN 123 persons, all males, of whom the most numerous were members of the Constabulary Force, 104—chiefly located in Steevens' Hospital, and the Depot in the Phænix Park; and 16 were law clerks.

Occupations of Patienta

Sixty-six persons, 57 males and 9 females, in public hospitals, had occupations which in Public directly or indirectly ministered to literature and education, of whom 20 were teachers, Hospitals. 19 writing clerks, and 14 printers.

Of those ministering to conveyance and travelling—88 males and 1 female—31 were sailors, and 10 were coach or car owners or drivers.

Of the occupations of the remaining classes, 10 ministered to health, 3 to amusement, and 1 to charity. Among the unclassified, numbering 1,390, we find 504 labourers, 32 dealers, 26 householders, 14 pensioners, and 12 shop assistants. In 788 instances the

occupations, if any, were unspecified.

Table IV., on the opposite page, shows the religious profession of the 2,993 patients in Religious hospital to be as follows:—2,389 were Roman Catholics; 509 were of the Established Profession of Patients Church; 71 Presbyterians, 6 Methodists, 2 Baptists, 14 of all other Christian persuasions, Assuming that the 14 of all other persuasions belonged to Protestant sects, as shown by the general Tables of Education and Religion, in Part IV., the numbers divide into 2,389 of the Roman Catholic and 602 of the Protestant faith.

Table V., on the two succeeding pages, shows by Ages and Sexes the diseases of the Diseases of patients under treatment in the Infirmaries, Fever, General, and Special Hospitals in Patients. Ireland. The materials from which it was compiled—the registries of Hospitals, many of which institutions afford public clinical instruction, may be assumed to possess greater faithfulness than those of other sanitary institutions not similarly situated.

Of the total 2,993 cases afforded by that table, in 51 instances the disease was not

specified in the Census Returns, and in 1851 only 8 such deficiencies occurred.

Among the zymotic class of diseases, numbering in this return 657 persons—369 females Fever and 288 males—the item of greatest amount is that for fever, under which 245 patients, and other 109 males and 136 females, laboured on the night of the 7th of April, 1861. Among these Diseases. are not included the 32 "pauper" or workhouse patients in the six Fever Hospitals already specified in the table of these institutions given at page 80. Of the total 245 fever cases, 236 were in special Fever Hospitals, and the remainder in General Hospitals. In 1851, out of a return of 3,839 persons in Public Hospitals of the same class as the foregoing, the number of fever cases was as many as 1,107. This great reduction in the number of persons affected with fever in 1861 must be matter of congratulation The next most numerous to all those interested in the sanitary welfare of the country. entry in the class of zymotic diseases is that for ophthalmia, amounting to 147, or 11 less than in 1851. Syphilitic cases in hospital had decreased from 204 to 140, viz., 84 females and 56 males. Exactly the same number of cases of small-pox (8) appear in the returns for both periods. Measles and scarlatina, of which there were only 5 cases in 1851, had, by the returns for 1861, increased to 26, viz., 15 of the former and 11 of the latter disease.

Among the sporadic diseases, those of the brain, nervous system, and organs of sense, the Diseases of cases of which, in 1851, amounted to only 107, had, according to the recent inquiry into the Nervous Hospital Status in Ireland, increased to 154-87 males and 67 females. In this return the System. most numerous entries are 48 for paralysis, 29 for diseases of the eye, 24 for nervous diseases, including cases of chorea, neuralgia, and nervous affections undefined, and 10 for disease of ear.

In 1851 the return for patients in hospital affected with diseases of the circulating Circulating organs was 42. According to the present Census it was 73, or 50 males and 23 females, Organs.

the principal items being 50 for heart disease and 13 for aneurism. The entries for diseases of the respiratory organs, which in 1851 only amounted to 270, Respiratory now reach 344, the sexes being 241 males and 103 females. Of these, that for bronchitis Organs. was 109; inflammation of lungs, 48; consumption, 79; cynanche, including diseases of the throat, larynx, and windpipe, 27; asthma, 10; and chest affections unspecified, 70. It cannot of necessity be deduced from these returns that the diseases of the respiratory organs have increased in Ireland since 1851, for at that period it must be remembered that a large amount of general hospital accommodation was occupied with fever cases, the result of the epidemic under which the country then laboured.

Diseases of the digestive organs, for which a return was made from the public hospitals Digestive of 217 cases in 1851, amounted in 1861 to only 187, of which dropsy, 47; dyspepsia, 45; Organs. disease of stomach, 29; liver complaint, 16; gastric fever, 15; and disease of intestines, 12, were the most numerous. The sexes in this class were 103 males and 84 females.

The return for diseases of the urinary organs, which, on the former occasion, was but Urinary 55, had increased in 1861 to 60, of which number 44 were males and 16 females. The Organs. [continued on page 111.

TABLE V.—Showing, by Ages and Sexes, the Diseases of Patients in the Infirmaries,

chief entries under this head were—urinary disease, 26; disease of bladder, 12; and The Sick is diabetes, 9. There were only 3 cases of stone in public hospitals on the night of the Hospitals. Census inquiry.

Affections of the generative organs, for which a return was received of 117 cases in Generative 1851, now afford but 102—92 females and 10 males. Of these cases, 43 were women Organs, in childbed, or the parturient or puerperal state, on the night of the 7th of April, 1861, in the 9 Lying-in Hospitals from which returns have been received—a very small number considering the large amount of accommodation (227 beds) afforded by these institutions. The other principal items in this class are paramenia, or disordered menstruation, 28; cancer of the uterus, 12; and other diseases of the genital organs, 19; of which number in 10 cases the patients were of the male sex.

Cases of diseases of the locomotive organs, of which 611 were recorded in 1851, by the Locomotive present returns amount to 624—or 411 males and 213 females. Of these, rheumatism Organs. 169, is the most numerous; next in numerical order are cases of diseases of bones and

HOSPITALS.

THE SIGN IN joints, 165; fractures, 147; spine disease, 46; hip disease, 43; dislocations, 31; lameness undefined, 15; and amputations, 8.

The number of cases of diseases of the tegumentary organs returned in 1851 was 332; tary Organs. in 1861 it has been 316, of which 196 were males and 120 females. Of these, the chief item was ulceration, 160 cases; the instances of psoriasis and other skin diseases were 91: of fistula, 17; scald-head, 16; anthrax, 11; itch, 7; and purpura and scurvy, for which there was a return in 1851 of 12 cases, had fallen to 4.

Disease of uncertain seat.

In 1851, the return of cases of diseases of uncertain seat (exclusive of wounds) in public hospitals was 298, and in 1861 it was 252, viz.,—141 males and 111 females. The chief items in this class were scrofula, 65; abscess, 60; cancer and fungus, 34; tumours, 28; infirmity, debility, or old age, 19; gout, 23; mortification, 12; and inflammations unspecified, 11.

Accidents.

The number admitted for accidents in public hospitals in 1851 was 165, including 107 for wounds, and in 1861 it amounted to 173—the sexes being 123 males and 50 females. Of these 108 cases were for wounds; 36 burns or scalds; 5 injuries of head; 4 poison; 1 the effects of cold and starvation; and 19 injuries and accidents unspecified.

Ages of Patients in Public Hospitals.

The foregoing table, together with that for occupations already described, shows the ages and sexes of the 2,993 patients in hospital at the time of taking the Census. From these we learn that 56 patients—28 males and 28 females—were under 5 years of age; 96 from 5 to 10, viz., 51 males and 45 females; from 10 to 20 the number was 746, and the sexes, 388 males and 358 females; from 20 to 40 it was 1,228—or 664 males and 564 females; from 40 to 60 the number of patients amounted to 582—the sexes being 391 males and 191 females; between 60 and under 80 the number was 250, and the sexes, 172 males and 78 females. There were 14 male and 7 female patients, in all 21, upwards of 80 years of age; and in 14 instances—8 males and 6 females—the ages were unspecified.

REPORT UPON THE NUMBER AND CONDITION OF THE VARIOUS ASYLUMS, HOSPITALS, ALMS Houses, Penitentiaries, and other Charitable Institutions for the permanent RESIDENCE OF THE DISTRESSED, SICK, AGED, OR INFIRM, IN IRELAND, ON THE NIGHT OF THE 7TH OF APRIL, 1861.

THE INMATES OF CHARITABLE Institu-TIONS.

In the Report upon the Status of Disease, published in 1851, an attempt was made for the first time to enumerate specially, and classify the inmates of the several asylums and charitable institutions intended for the permanent residence, care, and support of the distressed sick, aged or infirm; and the majority of which institutions partake of the nature of alms houses. The subject was entertained even in its then imperfect form, in order, say the Commissioners, "that it may lay the foundation for future investigations."

Asylumsand Charitable Institutions.

We are now enabled to present a more detailed account of those 92 asylums which have not been included in any of the foregoing sections of this Report. They are situated in the City and Suburbs of Dublin, the Cities of Kilkenny, Cork, Limerick, and Waterford; the Towns of Belfast and Londonderry, and the Counties of Meath, Westmeath, Cork, and Down. Table I., on the opposite page, shows, according to the date of their erection in each locality, the amount of accommodation, and the number of inmates, healthy and sick, in each institution on the night of the 7th of April, 1861. In chronological order they date from 1499—when St. Canice's Alms House in Kilkenny was established—to 1859, and are capable of accommodating 2,510 persons. The sick in the alms houses and kindred institutions are included among "the sick at their own homes," reported on at page 129. In addition to the 123 invalided soldiers in the Royal Hospital of Kilmainham, 25 were in the infirmary of that institution on the night of the 7th of April, and are included among the patients in the Dublin Hospitals at page 100. Of the inmates of Simpson's Hospital, 27, the balance of the blind already enumerated at page 44 were returned as gouty"-blindness and gout being the usual passports into that asylum.

Of the 70 patients in the Dublin Hospital for Incurables at Donnybrook, aged from 17 to 84 years, the following is a summary of their diseases:—14 had paralysis; 9, rheumatism; 9, diseases of bones and joints; 8, consumption; 7, cancer; 4, asthma; and 19 other diseases. Of the 25 invalid soldiers, aged from 54 to 92, in the Infirmary of the Royal Hospital, Kilmainham, rheumatism, paralysis, and bronchitis were the principal affections under which they laboured. The sick of both these institutions are included in the General Summary of diseases for all Ireland. In Table I. are included 14 Magdalen or Penitent Asylums which existed at the time of taking the Census. In March, 1851, the

number amounted to 16.

Occupations of Inmates of Charitable Institutions.

Table II., on pages 114 to 117, both inclusive, shows the occupations of the inmates of the asylums and charitable institutions specified in Table I. Of these, the occupations of 53 persons—36 males and 17 females—ministered to food, among which the most numerous was that of labourers, 16. The occupations which minister to clothing, afforded the [continued on page 116.

Table I.—Showing the Number of Hospitals, Asylums, Alms Houses, Penitentiaries, and other Charitable Institutions for the Permanent Residence of the Distressed, Sick, Aged, or Infirm in Ireland, on the Night of the 7th of April, 1861.

IMMATES OF CHARITABLE INSTITUTIONS.

Occupations of the Inmates of Asylums.

THE

principal returns derived from these institutions, and number 587 persons, viz., 530 females and 57 males. Among these the principal occupations were laundresses, 378; seamstresses, 75; boot and shoe makers, 26; weavers, 20; dressmakers, 29; tailors and vest makers, 11; boot and shoe binders, 11; and flax spinners, 10. Among those ministering to lodging, furniture, and machinery, amounting to 254—consisting of 192 females and 62 males—the most numerous occupation was that of servant, of which there were 188 instances of females and 21 of males, in all 209. Twenty persons had ministered, in their various callings, to conveyance and travelling; 28 to literature and education, in which class there were 22 teachers; 1 ministered to amusement; 8 to health, of which 6-had been nursetenders; and 137 to justice, including 123 pensioners in the Royal Hospital for Invalid Soldiers, at Kilmainham.

Among the unclassified, 113 were at school, chiefly in the Belfast Charitable Institution, which admits persons at all ages; and in 784 instances the occupations, if any, were unspecified.

Table II. likewise shows, by sexes, the ages in quinquennial periods of the inmates of

Ages.

Immates of Asylums and Charitable Institutions, on the night of the 7th April, 1861—continued.

asylums and charitable institutions: from which it will be seen that 223 were under 20, chiefly persons in the Belfast Charitable Institution; the numbers from 20 to 40 years of age were 434; from 40 to 60, they were 404; and from 60 to 90 and upwards, as many as 1,017. In 9 instances the age was unspecified.

Table III., on the following page, contains the classified result of the returns for the religious professions of the foregoing in the three provinces which contained eleemosynary Nine hundred and seventy-nine were Roman Catholics; 933 were of the institutions. Established Church; 132 were Presbyterians; 35 Methodists; 6 Independents, and 2 of other persuasions.

From Table IV., also on page 118, and which shows the education and marriage state Education of the inmates of these charitable asylums, we learn that 1,767 were educated, of whom and Mar-1,272 could read and write, and 495 could read only, and that 320 were in ignorance.

Of the total 2,087 persons in charitable asylums, 952 were or had been married, and 1,135 were unmarried.

THE
INMATES OF
PRISONS
AND REFORMATORIES.

Report upon the Number and Condition of the Inmates of Prisons, Bridewells, Convict Depots, and Reformatories in Ireland on the Night of the 7th of April, 1861.

Next in importance to the gratifying change in the condition of the Irish Workhouses since 1851,—upon which we reported at page 78,—the most manifest improvement which has come under our notice in connexion with this department of Vital Statistics is that respecting the number and condition of the inmates of prisons as returned on the 7th of April, 1861. On the 30th of March, 1851, the number of prisoners in the different

Gaols, Convict Depots, Bridewells, Police Stations, and Penitentiaries (as these latter class of prisons then existed), was 15,609; of these 577 were debtors, 286 dangerous lunatics, or idiots, 2,300 were untried prisoners; and as many as 12,446 were convicted prisoners or in the proportion of 1 to every 526 of the population. That lamentable state of things, while it may be accounted for by the antecedent and even then existing condition of the country, contrasts the more forcibly with the returns upon which it is now our province to report.

Tinn INMATES OF Prisons AND REFOR-MATORIBE.

Prisoners in Gaols, Prisons, Bridewells, and Convict Depots were enumerated (as in Mode of 1851) on "Form K," and the sick thereof on the Hospital "Form F." The Reformatories conducting were taken on "Form A," and the Schools on "Form L." The classified result of the the inquiry.

the inquiry.

prison inquiry is given in the following Tables:-

Table I., given below, shows by counties, cities, and towns, in alphabetical order, all the circumstances referred to above; but it differs from the kindred table published in 1851, in having the towns of Belfast and Galway separated from their respective counties; and also in having the prisoners in convict depots, and the persons in reformatories, distributed throughout the different counties, cities, and towns from which they were committed; and

Table I.—Showing the Number of Persons confined in the different Prisons in Ireland on the night of the 7th of April, 1861, with the Number and Proportion of Sick to Healthy, and of Convicted Prisoners to the Population of each County, City, and Town; -those in Convict Depots and Reformatories being distributed according to the localities from which they were received.

THE
INMATES OF
PRISONS
AND REFORMATORIES.

in having the proportions of convicted prisoners to population calculated thereon for each locality. On the night of the 7th of April, 1861, the total number of persons confined in the various gaols, prisons, bridewells, police stations, and reformatories in Ireland, was only 4,702, viz., 3,166 males and 1,536 females, as contrasted with 15,609 in 1851, and exclusive of 33 male and 39 female children, who were permitted to remain with their mothers on account of their tender age.

Debtors, Untried Prisoners, and Lunatics,&c. Of the total number of prisoners in 1851, as many as 577 were in confinement for debt; and in 1861 but 183, or 170 males and 13 females. The number of untried prisoners on the former occasion, was 2,300, and at the time of the recent inquiry but 374, or 240 males and 134 females. The number of lunatics, idiots, and epileptics in gaols in 1851, was 286; at the time of taking the present Census it was 299, of whom 188 were males and 111 females, as already detailed in Table VIII., at page 72 of the special Report on the Insane and Idiotic. This is the only class of prison inmates in which a very considerable reduction in numbers has not taken place since the last decade.

Reformatories and Convict Depots. As stated at length in our recently presented Report on Ages and Education, the Reformatory laws came into action in Ireland in 1858; and the results, as afforded by the Census inquiry, are presented in the following Table, which gives the number of prisoners in the six convict depots and the eight reformatories—separate from Table I.—which includes both of these classes of prisons.

Table II.—Showing the Number of Prisoners in Convict Depots and Reformatories on the night of the 7th of April, 1861, with the Number and Proportion of Sick to Healthy.

According to the present improved prison system, all gaols, especially convict prisons and reformatories—the latter in particular—are not only correctional but educational institutions.

As for wholesome purposes the Legislature empowers Judges and Magistrates to send juvenile offenders to reformatories, for periods varying from one to five years, who under the former system would have been imprisoned for only a few weeks or months, the 446 persons, 300 males and 146 females, in these institutions at the time of taking the Census, have considerably increased the number of "convicted prisoners" in Ireland, which would, but for that circumstance, have been much less.

According to the Act 21 & 22 Vic., cap. 103, sec. 7, the reformatories are all of a denominational character with respect to religion.

Convicted Prisoners.

The column in Table I., on page 119, which more particularly tests the state of crime in the country for some years preceding the date of the present inquiry, is that showing the number of convicted prisoners—amounting to only 3,846 in 1861, the sexes being 2,568 males and 1,278 females; whereas in 1851 it included as many as 12,446, or 1 in every 526 of the population, and did not at that time embrace reformatories. The proportion in 1861 is but 1 in 1,508, varying in the provinces as follows:—In Connaught, which holds the first rank in immunity from detected crime, 1 in 2,702; in Ulster, 1 in 2,239; in Munster, 1 in 1,373; and in the metropolitan province of Leinster, 1 in 940;—as shown by the summary at foot of Table I.

The following summary shows, by counties, cities, and towns, the proportion of convicted prisoners to the population in 1861 and in 1851. The numbers to the left of each name column show the recent condition of these localities as regards freedom from crime, and those to the right, the place which such counties, cities, or towns occupied in that respect They vary from 1 in 320 to 1 in 4,994.

THE INMATES OF PRISORS AND REPOR-MATORIES.

Sligo holds the first place and Dublin City the last; but the localities in which the Proportion most manifest improvement has taken place, are the counties of Kerry, Galway, Meath, Prisoners to Queen's, Sligo, and Antrim. Those that have not, according to the foregoing calculation, Population held the places they occupied in 1851, though still high in the scale, are Down, London- in 1851 and derry, and Leitrim.

While, however, these results afford an approximation to the truth, they must be received with caution; for, to make the calculation more exact, the variation of population and the amount of emigration or immigration in each locality should be taken into account, had materials for the latter purpose been available.

The education and marriage state of the prisoners in the various prisons, reforma- Education of tories, &c., in Ireland are given below in Table III. Of the total 4,702 persons so situated, Prisoners. as many as 3,494 were educated, and 1,208 uneducated; and of the former class 2,528 could both read and write, and 966 could read only. But how many of these literate

persons had been taught, or were then receiving instruction in prison schools, we have no means of knowing, except so far as relates to reformatories, the educational status of the inmates under detention in which both at the time of their admission and on a

THE INMATES OF PRISONS AND REPOR-MATORIES.

Education.

Marriage State. certain day subsequent to the date of our inquiry, has been already afforded at page 41 of our "Report on Ages and Education." However acquired, the amount of education among the prison inmates is greater than what has been usually supposed. The rate per cent. of ignorance in persons five years old and upwards in 1861, for all Ireland being 39, and in prisons, &c., only 26. The disproportion of the sexes of those who "read and write" is remarkable, the males being 2,097, and the females only 431.

Of the 4,702 persons in confinement in the Irish prisons on the 7th of April, 1861, as many as 3,302—viz., 2,271 males and 1,031 females—were unmarried; and 1,400 persons—

895 males and 505 females—were married.

Religious Professions of Prisoners.

The religious profession of all the inmates (tried and untried), of prisons in Ireland, are afforded by the foregoing Table; 3,960 were Roman Catholics; 591 were members of the Established Church; 144 were Presbyterians; 2 were Quakers; 1 was an Independent; 1 a Methodist; and 3 belonged to the class set down in the general tables for religious profession as "all other persuasions." Of the 3,846 convicted prisoners, 3,251 were of the Roman Catholic persuasion; and 595 of those coming under the head of Protestant.

Next to the relationship between crime and ignorance or education, in reviewing the condition of prison inmates, as afforded by the Census returns, is the subject of occupations as indicative of the callings and class of life from which these criminals and accused persons have been supplied. Table V., on pages 124 to 127 inclusive, shows by ages and sexes the occupations of the inmates of all the prisons specified in the foregoing portions of this section of our Report. By it we perceive that 777 had ministered to food, of whom Occupations 440-viz., 403 males and 37 females-were farm-labourers or servants; 212 persons-205 males and 7 females—were land holders; 34 were bakers; and 19 butchers.

Among the class that ministered to clothing, numbering 508 persons, 134 were shoemakers, 107 tailors, 91 weavers, 57 seamstresses, 28 pedlers, 19 dressmakers, 13 washer-

women, and 10 drapers.

Of those ministering to lodging, furniture, and machinery, the number of persons in which is 572, or 297 males and 275 females, as many as 328, viz., 62 males and 266 females, were domestic servants; 28 were carpenters; 28 house painters; 26 blacksmiths; 23 tin-workers; 16 stonecutters; 11 coopers; and 10 each of masons, nailers, and chimney-

Among the 122 males that composed the class which ministered to conveyance and travelling, 59 were sailors, including 6 boat or ferrymen, 13 were coach or car owners,

or drivers, 9 were horse-trainers, 7 coach or car-makers, and 7 letter-carriers.

Six prisoners were commercial travellers, and belonged to the class which ministered

to banking and agency.

Among the class ministering to literature and education, in which there were 55 persons, the chief occupations were—writing clerks, 29; and teachers, 14, of whom 1 was a female.

Two persons in prison were returned in the class ministering to religion, and 9 in that

appertaining to health.

One hundred and fifteen persons, all males, belonged to the class of occupations which minister to justice, of whom 98 were soldiers, either committed by civil judges or handed over for imprisonment by the military authorities.

Of the class which ministers to amusement there were only 6 persons in prison.

The numbers in the section for unclassified, including those without a specified occupation, are, as might be expected, disproportionally large, amounting to 2,530, or more than one-half of the entire. Of these 142 persons—86 males and 56 females—were dealers, and 25 shopkeepers. Nine hundred and ten prisoners—797 males and 113 females—were returned as labourers unspecified; 60 were prostitutes; 46, beggars; and 14, pensioners. As many as 513 males and 810 females, in all 1,323, had no specified occupations.

Table V. also shows, in quinquennial periods, the ages of the 4,702 persons confined Ages of in the different prisons and reformatories in Ireland at the time of taking the Census. Prisoners. By it we learn that 216 persons were from 5 to 15 years of age; of the remainder 792 were aged from 15 to 20; 2,107 from 20 to 30; 1,222 from 30 to 50; and 361 between

that age and 85. In 4 instances the age was not specified.

It now only remains to analyse Table VI., and report on the number and the diseases The Sick in of the sick in prison hospitals on the night of the 7th of April, 1861. From that table, which is given on pages 128 and 129, we learn that of the total 4,702 inmates in confine. Hospitals. ment in prisons, convict depots, bridewells, and reformatories, &c., 461 persons—278 males and 183 females—were under treatment in the hospitals or infirmaries of these institutions, being, as shown in the penultimate column of Table I., in the proportion of 1 sick in In 1851 the ratio of sick to healthy was 1 in 15. every 10 of the prison inmates. These proportions vary exceedingly in different localities—from 1 in 5 in Fermanagh to 1 in 148 in the city of Limerick. In the provinces the ratio of sickness in prisons and reformatories is 1 in 15 in Munster and 1 in 9 in each of the other provinces.

Of the total 461 persons under treatment in prison hospitals, 30 laboured under Diseases of epidemic or contagious diseases, of which number 12 were affected with diarrhea.

The return for persons affected with diseases of the brain and nervous system was 305, of whom 272 were insane. Four persons laboured under diseases of the circulating, and 21 under those of the respiratory organs, among which there were 11 cases of bronchitis. Fourteen persons were in hospital for diseases of the digestive organs; 1 for urinary disease; 7 women were in childbed; 12 persons had affections of the locomotive organs; and 23 were under treatment for diseases of the skin and tegumentary system, including Among the 33 persons in prison hospitals for diseases of uncer-13 cases of ulceration. tain seat, 12 were returned under the vague term of scrofula, and 16 set down to the item "infirmity, debility, or old age." Nine persons laboured under the effects of accidents, 1 of which was an attempt at suicide. In only two cases the cause of disease was unspecified.

Report upon the Number of Sick at their own Homes;—and Summary of the total Number of Persons labouring under Permanent or Temporary Diseases in IRELAND ON THE NIGHT OF THE 7TH OF APRIL, 1861.

THE SICK AT THEIR own Homes.

The only other subject within the scope of this part of our Report on Vital Statistics with which we have now to deal, is that relating to the Sick at their own Homes. The following remarks, published in the Report on the Status of Disease for 1851, so fully explain the objects, nature, and mode of inquiry then adopted, that we reprint them on the present occasion.

"In order to make an approximation to the total number of Sick in Ireland at any one Mode of time, it became necessary to institute inquiries from the heads of families, and other acquiring persons capable of filling the returns, as to persons labouring under disease at their own information. homes, in private houses, or at lodging-houses, hotels, and other similar places of public resort. As this was an inquiry which was never before attempted in the British Isles, nor in any country of which the results have been published, we naturally felt some difficulty in the undertaking; yet we have reason to believe that this investigation was met by the public in the spirit in which it was intended. A Sick Return, "Form C," was distributed to the Enumerators, requiring an account of the members of the family, visitors, servants, and other residents, who laboured under Sickness, and who abode with each family on the night of Sunday, the 30th of March, 1851 [more recently on the 7th of April, 1861] together with the names, or initials of names, age, and sex, in order to secure identity; the rank, profession, or occupation of such persons when in health, that it might be seen how far particular trades or employments conduced to the production of any special class of disease; whether the person was then "able or unable" to follow his or her occupation, that it might be ascertained how many of the community, not in hospitals or public institutions, were rendered, by disease, incapable of contributing to the support of themselves or the community at large,—as well as the particular disease or accident which caused illness; and also how long the patient had been so affected."

THE SION AT THEIR OWN HOMES.

Method of

inquiry.

The reply to that inquiry in 1851 afforded a return of 32,977 persons, or 1 in every 190, who were labouring under diseases which for the most part incapacitated them from following their usual occupations, or ministering to the wants of the other portions of the community, not included in any of the foregoing sections of that Report. It was, no doubt, only an approximation to the actual number of sick, many of whom were probably omitted, either by partial miscarriage of the inquiry, or from motives of delicacy on the part of the patients or their friends. Still, until an opportunity has been afforded of testing that and the present returns by kindred vital statistics from other countries similarly situated with Ireland, they remain a standard for the proportion of the sick, and the diseases under which they labour on a certain day. Moreover, they afford, by comparison of one date with another, a means of judging of the state of public health at each decennial Census period—the only means which, together with the minute inquiry into the number, condition, and diseases of the deaf and dumb, the blind, lunatic, idiotic, epileptic, lame, or decrepit, and the inmates of workhouses, asylums, hospitals, and prisons—has yet been devised for this purpose in Europe or elsewhere.

By the following tabulated return, to this inquiry, we learn, that in addition to the 83,546 persons enumerated in the foregoing Tables of this Report, as many as 28,193 persons—13,662 males and 14,531 females—or 1 in every 203 of the community, not provided for

Table I.—Showing the Number, Age, and Sex of the Sick at their own Homes, as returned on "Form C.," and whether Able or Unable to follow their usual Occupations; together with their proportion to the Population not provided with Indoor Medical Relief, in the several Provinces, Counties, Cities, and Towns in Ireland.

elsewhere, were sick at their own homes on the 7th of April, 1861. In 1851, when the country was still labouring under the effects of the recent famine and pestilence, the proportion was, as already stated, 1 in 190.

Of these 28,193 sick persons, not in hospitals, workhouses, prisons, asylums, or public Ability or institutions, &c., 26,699 were returned as being, on account of their illness, unable to inability follow their usual occupations, and 1,494 were not prevented doing so.

of Sick to work.

The proportion of sick at their own homes varies from 1 in 142 to 1 in 942 in the

different localities specified, and in the provinces it was—in Munster, 1 in 218; in Connaught, 1 in 216; in Leinster, 1 in 198, and in Ulster, 1 in 192.

The religious profession, occupations, and state of marriage and education of these Religious 28,193 sick or ailing persons is given in Parts IV and V of the present Census Reports. Profession. Their diseases, with which we have now more particularly to deal, are afforded by the following Table, on pages 132 and 133—the county and provincial details of which are given in five Tables in the Appendix.

A nosological chart, or table of synonymous terms for analogous diseases, popular, Nosological provincial, or local names and expressions, amounting to as many as four hundred and arrange fifty, and also one hundred and twenty-five Irish names, was published in the Status of Diseases. Disease for 1851, but which we do not think it necessary to repeat in this volume of our Report on Vital Statistics.

Table II., on the two following pages, affords by diseases, not only the number of sick Total at their own homes in civic and rural districts, but also those in hospitals, lunatic asylums, workhouses, and other public charitable institutions; and thus becomes a summary of the numbers labouring under permanent or temporary diseases, included in all the foregoing tables in each section of this Report, but does not include the healthy in workhouses, prisons, reformatories, or asylums for the destitute aged or infirm.

In analysing this Table, the comparisons which may be instituted between the numbers for each disease in it, and those afforded by the analogous Table published in 1851, are of extreme interest, as they show, in a remarkable manner, the improved state of public

health in Ireland at the date of the recently taken Census.

## Report upon the General Summary of the Sick in Ireland on the Night of the 7th of April, 1861.

GENERAL SUMMARY OF THE SICK.

In 1851 the total number of persons returned from all localities as labouring under the class of zymotic or epidemic, endemic, and contagious diseases on a single day, was 34,998, or 1 in 3 of all the sick; and by the returns for 1861, that item had been reduced to as Diseases. few as 9,822—viz., 4,486 males and 5,336 females—or 1 in 8 of the total sick. Of these, Fever. 5,730 were returned on "Form C," from their own homes—572 from the civic, and 5,158 from the rural districts; 704 were afforded by the hospital returns, and 3,388 from those of workhouses. Of this class, the most numerous entry was that for fever, 2,350—viz., 1,274 females and 1,076 males—or 1 in 32 of the entire sick; while in 1851 it amounted to 13,777—or 1 in 8. These fever cases were thus distributed on the night of the 7th of April, 1861—1,235 were at their own homes—80 in the civic, and 1,155 in the rural districts,—a disproportion accounted for by the former localities being better supplied with hospital relief; 253 were in fever or general hospitals, and 862 in workhouses. 1851 the number of fever cases in workhouses were as many as 7,888.

**Epidemic** 

The next disease in numerical amount is influenza, 2,330—an affection which is more Influenza. or less prevalent in Ireland every spring, and of which there was a slight epidemic when the Census was taken in April, 1861. Of these cases, 2,069 occurred at their own homes, 21 in hospitals, and 240 in workhouses. The sexes were, 1,223 females and 1,107 males; and the proportion to the total sick, 1 in 33.

Of measles there were 1,308 cases—665 females and 643 males, or in the proportion of Measles. 1 in 58 to the total sick; distributed among persons residing at home, 1,107; under treatment in hospital, 16; and residents in workhouses, 185. In 1851 the cases of measles amounted to 1,035, being 1 in 101 of all the sick returned on that occasion.

The fourth most numerous disease for which returns have been received, is ophthalmia, Ophthalmia. 1,307, viz., 841 females and 466 males, or 1 in 58 of the total sick; as against 3,883 cases of that disease returned in 1851, when the proportion was 1 in 27. Of these 1,307 cases of ophthalmia, upon which we have already reported in the section devoted to the consideration of the blind, 154 were at their own homes, 154 in hospitals, and 999 in workhouses.

Diarrhœa and dysentery-659 cases of the former, and 480 of the latter disease, in all Diarrhœa 1,139, or 582 females and 557 males,—are the entries next in numerical importance in this and Dysentable. Of these, 257 cases of dysentery, and 184 of diarrhæa, occurred at the homes of tery. the patients, and 13 of the former, and 24 of the latter, were in the hospitals; while 210

GENERAL SUMMARY OF THE SICK. cases of dysentery, and 451 of diarrhea, were under treatment in workhouses. The proportion of cases of dysentery to those of all other diseases, is 1 in 158, and of diarrhea, 1 in 115. In 1851, the number of cases of dysentery returned for the country at large was 6,716, or 1 in 16 of the total sick; and those of diarrhea, 3,013, or 1 in 35.

Syphilis.

Eight hundred and twenty-four cases of syphilis were extracted from the returns afforded by the Census of 1851; while in those for the present occasion they only amount to 370—237 females and 133 males, distributed as follows:—only 16 were returned as labouring under this affection at their own homes—no doubt a defective return from the very nature of the affection, especially in a country where there is no public or police supervision of that disease. In 1851, only 25 cases were returned from the civic and rural districts of Ireland. Of the remaining cases of syphilis afforded by the present Census, 144 were in hospitals, and 210 in workhouses.

Scarlatina.

The next disease of numerical importance in this class is scarlatina, for which there is a return of 266 cases—138 males and 128 females, being 1 in 286 of the total sick from all causes. Of these cases, 221 were returned from their own homes, 11 from hospitals, and 34 from workhouses. In 1851 the return for scarlatina was 324, or 1 in 323 of the total sick.

Erysipelas.

Erysipelas prevailed to the extent of 228 cases—128 females and 100 males—being 1 in 333 of the total sick; and distributed as follows—163 at their own homes, 26 in hospitals, and 39 in workhouses. In 1851 the instances of erysipelas amounted to 256, or 1 in 408 of the entire sick.

Hooping-cough.

Hooping-cough, of which there was a return in 1851 of 359 cases, or 1 in 291, amounts on the present occasion to only 153—87 females and 66 males—or 1 in 497 of the total sick; of these, 95 were at their own homes, and 58 in workhouses.

Small-pox.

Small-pox, which in 1851 afforded a return of 888, or 1 in 118, had reduced in number to 116, or 1 in 655 of the total sick; the sexes being 61 females and 55 males; and the distribution of cases—86 at home, 8 in hospital, and 22 in workhouses.

Of the remaining diseases in the epidemic or endemic class, 34 were cases of croup, 7 of thrush, 11 of pemphigus, 81 of ague, 1 of cholera, 1 of hydrophobia, 3 of glanders, 79 of gonorrhæa, and 38 of numps: numbers very analogous to those afforded by the returns for 1851.

Total Sporadic Diseases. Among the sporadic diseases of the brain, nervous system, and organs of sense, a return was made in 1851 of 24,522 cases, or 1 in 4 of the total sick persons at that period. According to our recent inquiry, the numbers for the same class were 28,939, or 1 in 3 of the total 76,008.

Insanity.

Of these the most numerous were cases of insanity, amounting to 7,056—viz., 3,497 males and 3,559 females—or 1 in 11 of the entire sick; whereas, in 1851, the number was 5,064, or 1 in 21 of the total. These 7,056 insane persons, afforded by the returns of 1861, were distributed as follows—1,602 were at home, or in the custody of their friends; 4,885 were in lunatic asylums, hospitals, or gaols; and 569 were in workhouses,—as already detailed in the Report on the Lunatic and Idiotic, in the third Section of this Report, page 56.

Idiocy.

Of idiocy, as already stated in the special Report on that subject, there were 7,011 cases—5,675 at their own homes, 424 in hospitals and asylums, and 912 in workhouses. Its proportion is 1 in 11 of the total number; in 1851 the amount of idiocy was 4,848, or 1 in 22.

Blindness.

Instances of blindness, upon which a special Report has been already made in Section II., amount to 6,566—viz., 3,054 males and 3,512 females, or 1 in 12 of the entire number of persons labouring under temporary or permanent diseases on the 7th of April, 1861. They were thus distributed—5,662 were at their own homes, 287 in hospitals, and 617 in workhouses. In 1851 the number of the blind was 7,284, or in the proportion of 1 in 14 of the total sick returned on that occasion.

Deaf-dumbness. The fourth most numerous entry in this class is that for deaf-muteism, amounting to 5,002—viz., 2,751 males and 2,251 females—being in the proportion of 1 in 15 of the total sick, and distributed as follows—at their own homes, 4,420; in workhouses, 141; and 441 in asylums—all the circumstances attending which, and their distribution, &c., have been already fully described in the Section from page 1 to 34 of this Report. The total deaf-mutes in 1851 was 4,337, or 1 in 24 of the entire number of persons affected with either temporary or permanent disease at that period; and in 1861 it was 1 in 15.

Paralysis.

Paralysis, which in 1851 afforded a return of 1,375 cases, being in the proportion of 1 in 76 of the total sick, amounts on the present occasion to 1,654—882 males and 772 females—or 1 in 46. Of these, 1,024 were received from returns made from their own homes, 68 from hospitals and asylums, and 562 from workhouses.

Epilepsy.

Epilepsy, amounting in 1851 to 856, or 1 in 122 of the total sick, has, by the more searching inquiry made in 1861, decreased to 578, or 1 in 132, the sexes being 208 males and 370 females. Of that number 188 were at their own homes, or returned on "Form C,"

16 were in asylums or hospitals, and 374 in workhouses or workhouse hospitals, as

already reported on at pages 70 and 71 of this Volume.

The affections classed under the head of "Nervous Diseases," have afforded a return of 319 cases—243 females and 76 males—the proportion to the entire sick being 1 in Nervous They were thus distributed—248 were at home, among whom, it is probable, there Diseases. were many cases of insanity, idiocy, and epilepsy, 25 were in hospital, and 46 in work-In 1851 the cases of nervous diseases were but 42, of which number 18 were in hospital, and 24 in workhouses. There was no return under this head from persons at home at that period.

The other diseases of the nervous system range in numerical importance in the follow-

ing order:

Headache, 413 cases—255 females and 158 males—of whom 332 were at their own Headache. homes, 9 in hospital, and 72 in workhouses.

Inflammation of the brain, 95—the sexes being 50 females and 45 males—of which Inflammanumber 50 were returned as sick at their own homes.

Disease of ear, 72—viz., 39 females and 33 males—the majority of which were probably Aural cases of deafness, consequent on otorrhea. Of these, 36 were at home, 10 in hospital, Diseases. and 26 in workhouses.

Hydrocephalus, or water on the brain, 64, or 34 females and 30 males, of whom 55 Water on were at home, 3 in hospital, and 6 in workhouses.

Apoplexy, 49-viz., 27 males and 22 females; of which number 39 were at their Apoplexy. own homes, 2 in hospital, and 8 in workhouses.

Convulsions, 28 cases—17 males and 11 females—18 at their own homes, none returned Convulsions. from hospitals, and 10 from workhouses.

Disease of nose—probably polypi—19 cases—7 males and 12 females—2 at home, 5 in Disease of hospital, and 12 in workhouses.

Delirium tremens, 7, or 5 males and 2 females; of which number 6 were returned Delirium on "Form C," from their respective homes, 1 was in a workhouse, and there were no Tremens. cases of this disease recorded on the hospital forms.

There were 3 cases of tetanus in hospital—2 males and a female.

The proportions for each of these nine diseases are given in the last column of the fore-

going table.

The returns for diseases of the circulating organs on the 30th of March, 1851, were 534, Diseases of being, for the entire class, in the proportion of 1 in 196 of the total sick on that day. By the present returns it appears that as many as 922 persons—539 females and 383 males, were labouring under such affections, the proportion for the total to all other diseases,

being 1 in 82.

The chief increase has been in the numbers returned as affected with disease of the Disease of . heart, amounting to 780, of whom 472 were females and 308 males, being in the proportion to the total sick of 1 in 97. In 1851 the cases of cardiac affections amounted to only 365; a disproportion between the returns for the two periods, to be accounted for by supposing either an increase of such affections, an improvement in general, as well as medical diagnosis by which they are now more easily known and recognised, or by assuming, which is most probable, that according to the popular notions prevalent among the Irish peasantry, several other diseases (especially indigestion) were returned under Of the total 780 cases, 612 were returned on "Form C" from their own homes, and of these, 531 came from the rural districts—a fact that tends to support the foregoing view-55 were under treatment in hospitals, and 113 in workhouses.

The other diseases of this class were spitting of blood, 56-25 males and 31 females, of Homorrhwhich number, 30 were at home, 10 in hospital, and 16 in workhouses; many of these age.

were probably cases of phthisis.

The returns afford 39 cases of vomiting of blood—20 females and 19 males; 32 at their own homes, 7 in workhouses, and none in hospital. Thirty cases of general hæmorrhage— 16 males and 14 females, were returned, 20 from their own homes, 3 from hospitals, and 7 from workhouses; but from what organs, or how caused, has not been stated. Some of those returned on "Form C" may have been cases of "bleeding piles." The cases of aneurism, amount to 17, of which 15 were males and 2 females, viz., 1 from a rural district, 13 from hospitals, and 3 from workhouses.

The cases of diseases of the respiratory organs, amounted, in 1851, to 10,509, or in the Diseases of proportion of 1 in 10 of the entire class to the total number of sick on a certain day. The result of a similar investigation on the 7th of April, 1861, is but 9,145 cases—4.667

females and 4,478 males, or 1 in 8 of the total sick.

In this class, the most numerous return is that for consumption—a disease but too Consumpwell known to the people of Ireland—amounting to 2,650, the sexes being 1,487 females and 1,163 males, and the proportion to the total sick, 1 in 29. The entry under the

GENERAL SUMMARY OF THE SICK.

Tetanus.

GENERAL SUMMARY OF THE SICK. same head in 1851 was 4,182, or 1 in 25, so that so far as these returns may be depended on, they show a pleasing decrease of that malady in Ireland. Of these 2,650 cases of phthisis or consumption of the lungs, 2,238 were returned on "Form C," 1,886 from the rural, and 352 from the civic districts; 89 were under treatment in hospitals, gaols, &c., and 323 were in workhouses. The localities from which the greatest proportionate number of the cases of consumption were received are set forth in the Tables of the Sick by Counties, Cities, and Towns, in the Appendix to this Report, pages 142 to 159.

Inflammation of Lungs. The return for inflammation of the lungs amounted to 2,313, or 1,284 males and 1,029 females, of which number 2,163 were returned on "Form C" from their own homes, but how many of them were actual cases of pneumonia or of bronchitis, influenza or consumption, or simply undiagnosed affections characterized by cough or pain in the chest, it is not possible to say. The cases entered under this head, are in the proportion of 1 in 33 of the total sick; and in 1851 they amounted to 2,504, or 1 in 42. It may be assumed that the diseases returned on both occasions, were tolerably similar.

Bronchitis.

Bronchitis, a term of comparatively modern introduction, and chiefly known to the middle and upper classes, has afforded a return of 1,860 cases—937 males and 923 females, or 1 in 41 of the total, being 380 more than was stated in the returns for 1851. Their distribution in 1861, was 410 at home, 130 in hospital, and 1,320 in workhouses.

Asthma.

Asthma, an easily recognised affection, holds nearly the same place as regards amount of cases which it did at the time of our former inquiry, the numbers being then 1,129, or 1 in 93, and on the present occasion, 1,177, viz., 642 females and 535 males, or 1 in 65 of the total sick. Of these, 905 were at home, 15 in hospital, and 257 in workhouses.

Cynanche.

Of the 176 cases of throat affections classed under the term cynanche, and which are 96 less than in 1851, there were 109 returned from their own homes, 28 from hospitals, and 39 from workhouses.

Emphysema and Empyema. The cases of emphysema, or extravasation of air, were 12; of empyema, or fluid in the cavity of the pleura, 3; and the affections returned as "water on the chest," 9.

The cases of "chest affections unspecified" amount to 945, viz., 485 females and 460 males; 590 at their own homes, 71 returned on hospital forms, and 284 on those for workhouse infirmaries.

Diseases of Digestive Organs.

Dropsy.

The total cases of diseases of the digestive organs was, by the returns for 1861, but 3,767, viz., 2,006 females and 1,761 males, or 1 in 20 of the total sick from all causes;

in 1851 the number was 4,511, or in the proportion of 1 in 23.

From the returns now under consideration we learn that 952 cases of Dropsy—an affection not likely to be either mistaken or unrecognised—were registered from the different forms on which the diseases of the sick were supplied to the Census Commissioners. Of these 500 were females and 452 males; the proportion of this disease to the total sick being 1 in 80; and the distribution of the persons so affected was—692 were at their own homes, 50 were in hospital, and 210 in workhouses. In 1851 the return for cases of dropsy was 1,464, or 1 in 71 of the total sick; and in reporting on that disease the Commissioners say—"The chief item in this class was dropsy; and as this affection presents unmistakable symptoms, the returns of it are in all probability very Of what particular diseases of the liver, heart, kidneys, or lungs, the dropsical appearances manifested in those patients were symptoms, we have no means of determining; but ascites has long been recognised as one of the most frequent disorders among that class of the population of Ireland which live chiefly upon potatoes. far the alteration of food lately introduced in this country may hereafter affect the extent of this disease, will be determined by future investigations."—See Status of Disease for 1851, page 118. So far as the present returns afford truthful information, and taking into account the decrease of population since that period, they justify the foregoing observations. This decrease in dropsy, not dependent on organic disease, may, we think, be in part attributed to the alteration in the diet of the great bulk of the Irish people from potatoes to Inuian meal or other cereal food; as well as the decrease in chest affections is probably owing to the acknowledged improvement in the lodging and clothing of the lower classes.

Dyspepsia.

Five hundred and twenty-six cases of dyspepsia—343 in females and 183 in males—were returned, being 1 in 145 of the total sick; 177 were returned on "Form C" from the Civic and Rural Districts; 49 were in hospital, and 300 in workhouses.

Disease of Stomach.

Cases registered as disease of the stomach, amounting to 526, viz.:—280 females and 246 males—afford a proportion of 1 in 145 of the total sick, and were thus distributed: 400 were at home; 31 in hospital; and 95 in workhouses. In 1851 the entry under this head was only 384.

Liver Complaint. Under the head of liver complaint, a return was received of 510 cases—263 females and 247 males—being in the proportion of 1 in 149 of the total sick, and 3 less in

number than the return for that disease in 1851. Of these, 411 were at home, 19 in

hospital, and 80 in workhouses.

The next highest entry in this class is that for marasmus, a term applied to wasting and debility from various causes, both organic, structural, and symptomatic, but chiefly Marasmus. to affections of the abdomen, including chronic peritonitis and the tabes mesenterica of children and young persons. By the returns for 1851 this was the second most numerous item in the class of diseases of the digestive organs, amounting to 747; it now only numbers 275 cases—144 males and 131 females—or 1 in 276 of all the sick returned in 1861: of these cases 161 were at their own homes, 2 in hospital, and 112 in workhouses.

THE SICK.

GENERAL

SUMMARY OF

Two hundred and fifty-nine cases of worms, in 151 females and 108 males were registered Worms. from the returns—206 at home, 1 in an hospital, and 52 in workhouses. It is not a very

common affection among the working classes in Ireland.

There were 139 cases of colic—80 females and 59 males—126 at home, 5 in hospital, Colic.

and 8 in workhouses.

The 127 cases returned as "disease of intestines," viz., in 75 females and 52 males: Disease of 74 at home, 15 in hospital, and 38 in workhouses;—include cases of constipation, Intestines. ulceration, diseases of the rectum, &c. Ninety-one cases of hernia were returned—in 82 Hernia. males and 9 females: as many as 35 on "Form C," 10 in hospital, and 46 in workhouses. In 1851 "only 73 cases of hernia were returned, and but 27 of these from the sick at their own homes. From motives of delicacy the exact amount of this disease is never likely to be obtained with accuracy; so also with hemorrhoids, except when these excrescences are affected with inflammation, &c., and then the patients, being at the time confined to bed, are incapacitated from following their usual occupation."—Status of Disease for 1851, page 118.

The cases of piles returned for the 7th of April, 1861, amount to 89-62 in males Hammorrand 27 in females: 58 at their own homes, 6 under treatment in hospital, and 25 in hoids. Neither this disease nor rupture are very frequent affections among the

Irish peasantry.

Only 93 cases of gastric fever were returned—60 in females and 33 in males: 35 at Gastric their own homes, 15 in hospital, and 43 in workhouses. The returns for this disease Fever.

are probably defective, yet, in 1851, the cases of gastric fever amounted to but 53.

The other diseases of this class are—jaundice (which, like dropsy, is usually symptomatic), Jaundice. and amounted to 79 cases—43 males and 36 females: 60 from home returns, 4 from hospital, and 15 from workhouses. The cases of inflammation of the bowels amounted to 58, or Inflamma-33 females and 25 males: 47 were returned on "Form C," 3 from hospitals, and 8 from tion of workhouses. The cases of peritonitis (a kindred affection), were only 5. Thirty-eight Bowels. cases of "teething," or of affections consequent on difficult dentition, were afforded by Teething. the recent inquiry in 21 male and 17 female children: 25 at home, and 13 in workhouses.

The number of cases of diseases of the urinary organs returned for the 7th April, 1861, Urinary was 405, or 1 in 188 of the total sick from all causes, the sexes being 294 males and 111 Diseases. females. In 1851 the number for the same class of affections was but 289, or 1 in 362; and, as stated in the report for that period, it is scarcely possible from the nature of these affections to expect a complete return thereof from the sick at their own homes. The most numerous return in this class is that for "urinary disease," 199, or 141 males and 58 females, of whom 124 were at their own homes, 27 in hospitals, and 48 in workhouses.

Stone, a rather unfrequent disease in Ireland, afforded a return of 68 cases—54 males Stone. and 14 females—64 of which were returned on "Form C;" but as the popular term "gravel" is applied to several urinary affections, it is more than likely that other cases besides calcu-

lus are included in this number. There were 3 cases in hospital and 1 in a workhouse. Of the remaining diseases of this class, a return was received of 40 cases of disease of Disease of kidneys, 39 of diabetes, 33 of bladder affection, and 26 of stricture.

The affections of the generative organs afforded a return in 1851 of 693 cases, and in Disease of 1861 of 802—viz., 19 males and 783 females—or in the proportion of 1 in 95 of the Generative The principal item in this class is that for childbirth, affording a return of Organs. 642 cases (as against 553 in 1851); and were thus distributed—390 were at their own homes, 50 in hospital, and 202 in workhouses. Cases of paramenia, or disordered or irregular menstruation, amounted to 65; cancer of the womb to 42; disease of genital

organs, 35—19 males and 16 females; prolapsed womb, 10; and ovarian disease, 8. The return for cases of diseases of the locomotive organs is 8,607—the sexes being 4,479 Diseases of males and 4,128 females—and the proportion of this class to all other diseases, 1 in Locomotive In 1851 the number was 8,822, and the proportion 1 in 12. Of this class the most Organs. important item is that for rheumatism, 4,103—viz., in 2,202 females and 1,901 malesbeing 1 in 19 of the total sick at the time of the recent inquiry. Of these, 3,049 were at their own homes, 187 in hospitals and asylums, and 867 in workhouses.

General Summane of The Side.

Discusses of Bones and Joints.
Fractures and Dislocations.

The next most important item of this class is that for diseases of the bones and joints, numbering 585 cases—344 males and 241 females; 232 at their own homes, 170 in hospital, and 183 in workhouses. In 1851 the numbers registered under this head were 759.

As many as 513 cases of fracture, 354 in males and 159 in females, were afforded by the returns for 1861, and 519 in those for 1851. Of the former, 258 were at home, 156 in hospital, and 99 in workhouses. Three hundred and fifty cases of dislocation, 216 in males and 134 in females, were registered from the returns of 1861, 296 at their own home, 32 in hospital, and 22 in workhouses, as against 75 cases of dislocation afforded by the returns for 1851.

Spine and Hip Discases.

Spine diseases, of which there were returned 347 cases in 1851, now amount to but 295—165 males and 130 females. Of these 129 were received on "Form C," 51 were in hospital, and 115 in workhouses. Of hip disease, there were 194 cases—118 males and 76 females, or 89 less than in 1851, and were thus distributed—63 were at home, 46 in hospital, and 85 in workhouses.

Amputations

In 1851 we received a return of 58 cases of amputation, and in 1861 of only 31, or 21 males and 10 females, of whom 4 were at home, 10 in hospital, and 17 in workhouses.

Lameness.

Under the head of lameness, including the lame and decrepit already reported upon in Section IV., at page 72, we received a return of 2,536 cases—1,360 males and 1,176 females, or 1 in 30 of the total sick or disabled; while in 1851 the total of that class was 2,828, or 1 in 37. These 2,536 cases of lameness were thus distributed—401 were at home, 105 in hospital, and 2,030 in workhouses.

Skin Diseases.

The diseases of the skin and tegumentary system afford a return of 2,810 cases—1,688 males and 1,122 females; being in the proportion of 1 in 27 of the total sick. The chief item in this class is that for ulceration, affording a return of 1,404 cases—922 males and 482 females; 446 at home, 180 in hospital, and 778 in workhouses. There were 459 cases of psoriasis and other cutaneous affections classed under that head; 397 of itch; 276 of scald-head; and 101 of purpura and scurvy, viz.—60 at home, 4 in hospital, and 37 in workhouses. The other items in this class are—anthrax, 63; fistula 53; whitlows, included under the head of onychia and paronychia, 29; and chilblains, 28.

Cases registered under "diseases of uncertain seat" amount to 8,869, and the sexes,

Diseases of Uncertain Seat.

Cases registered under "diseases of uncertain seat" amount to 8,869, and the sexes, 5,121 females and 3,748 males—being in the proportion of 1 in 9 of the entire class, to the total sick, as compared with 10,394 cases, or 1 in 10 afforded by the returns for 1851. The most numerous entry in this class is that for the affections clubbed under the head of "infirmity, debility, and old age," and amounting to 5,843, or 3,697 females and 2,146 males; of which number, 3,041 were at their own homes, 38 in hospital, and 2,764 in workhouses. The proportion of these affections to the total sick is 1 in 13. In 1851 the cases so registered amounted to 6,001, or 1 in 17.

Age and Infirmity.

Scrofula.

The next most numerous item under this head is that for scrofula, 1,615, or 888 males and 727 females, being 1 in 47 of the total sick, and thus distributed—670 were at their own homes, 85 in hospital, and 860 in workhouses; while in 1851 the cases of scrofula were 2,654 or 1,039 more than the present returns afford. This disparity between the returns of the two periods may, in part, be accounted for by the fact of the diseases previously classed under the generic term of scrofula being, on the present occasion, better understood and returned in accordance with the present advanced knowledge of disease—under other affections; still it seems to be generally acknowledged that those outward and visible signs of scrofula, which were so manifest in former years, do not now present themselves in the same abundance; and it may be presumed that with the improved condition of the country scrofulous affections are becoming less frequent.

Cancer.

Cancer, for which disease there was a return of 353 cases in 1851, appears by the returns for 1861 to amount to 433, or 230 females, and 203 males, of which number 310 were at their own homes, 38 in hospitals, and 85 in workhouses. There were 3 cases of malignant fungus.

Abscess.

Three hundred and eighty-four cases of abscess were recorded, 195 in males and 189 in females; 132 at home, 71 in hospital, and 181 in workhouses.

Inflammation. Three hundred and seven cases of inflammation unspecified, in 163 females and 144 males, were returned upon the various forms collected by the Census Enumerators in 1861; of which number, 254 were at home, 13 in hospital, and 40 in workhouses. There were 173 cases of tumor, 91 in males and 82 in females; 120 at home, 31 in

Tumors.

hospital, and 22 in workhouses.

Seventy-three cases of gout 60 in males and 13 in females, were returned: 34 from

Gout.

Seventy-three cases of gout, 60 in males and 13 in females, were returned; 34 from their own homes, 29 from hospitals, and 10 from workhouses.

Mortifica-

The cases of mortification amounted to 25, viz., 14 males and 11 females; and there were 13 cases of phlebitis, 7 in females and 6 in males.

There were 1,223 cases of accidents, in 737 males and 486 females, or 1 in 62 of the entire, among which we find a return of 218 instances of burns or scalds, in 123 females and 95 males, of whom 94 were at home, 36 under treatment in hospital, and 88 in workhouses. The item for wounds is as high as 301, viz., in 195 males and 106 females; 80 at home, 114 under treatment in hospital, and 107 in workhouses; whereas in 1851 the entry under this head was only 278. Twenty-one cases of injuries of the head, in 16 males and 5 females, and 1 of attempted suicide, were recorded.

GENERAL SUMMARY OF THE SICK.

Accidents. Wounds.

In 1851 a return was received upon the various Census Forms of 191 cases of persons Cold and labouring under the "effects of cold or starvation;" and in 1861 the number returned Starvation. under that head was but 6. Of the total 1,223 cases attributed to accidental causes, 671 persons, 420 males and 251 females, were returned as "accidents unspecified."

Of the total 76,008 cases enumerated in Table II., on pages 132 and 133-697 were Unspecified returned as "sick," but without any specified disease, the sexes being 416 females and 281 males; 319 were from their own homes, 58 in hospitals, and 320 in workhouses.

The ages of all the foregoing 76,008 persons labouring under temporary or permanent Ages. disease in Ireland, at the time of taking the Census, are specified in Table VI., at page 156 of the Appendix; and in Table V., pages 150 to 155, the distribution of these persons according to their respective localities is set forth.

The amount of population unavailable as working members of the community differs Unavailable materially in the four provinces, which, taken in comparison one with another, serve in some degree to exhibit the proportion of poverty, sickness, and crime in these different localities. In Ulster we find but 1 in 65.21 of the population unavailable, either from sickness, infirmity, poverty, or crime; in Leinster, 1 in 42.89; in Munster, 1 in 43.89; and in Connaught, 1 in 69.83. For all Ireland the proportion is 1 in 52.27. In speculating upon the causes of these provincial disproportions, we must, in the words of the Report on the Status of Disease for 1851, (pages 115 and 119), "consider the relative amount of population, the character and industrial pursuits of the people, the extent of medical relief, the avenues for employment, and the incentives to crime. The period of the year at which any investigation of this nature is undertaken will likewise influence the general proportion, as respects poverty, disease, and crime—certain affections, particularly of an epidemic character, prevailing more at one season than another; the pauper population within the workhouses varying according to the season, the amount of food within reach of the working classes, or the demand for labour; crime being also influenced by season: and the number of criminals in the different prisons depending, to a certain extent, on the period of the assize or other judicial investigation. In arriving at the probable amount of population at the 'working age' not directly ministering to the general support of the country, we should include the number of persons employed in the care, custody, or other management of the foregoing persons, consisting of the staffs of the different public institutions, workhouses, hospitals, asylums, gaols, &c.; but as this question more properly belongs to the subject of occupations, further notice of it is reserved until that question is considered.

"Viewing a Census in the light of a Social Survey—in which the condition as well as the enumeration of all classes of the people should be considered—we believe that a knowledge of the nature, causes, and extent, as also the distribution and results of the epidemic and sporadic diseases of this country may tend to assist the Legislature in future sanitary investigations and improvements, not only in the necessary provision for the destitute,

but also in supplying suitable relief to the suffering.'

We have now, in conclusion, but to congratulate your Excellency upon the improved sanitary condition of the country, which, compared with its state in 1851, the foregoing report so fully exhibits.

We have the honour to remain,

Your Excellency's

Very faithful servants,

WILLIAM DONNELLY, Chief Commissioner. Registrar-General, WILLIAM R. WILDE, GEORGE W. ABRAHAM, Assistant Commissioners.

HENRY WILKIE, Secretary.

CENSUS OFFICE, DUBLIN, 17th July, 1863.

## CENSUS OF IRELAND FOR THE YEAR 1861.

#### REPORT ON TABLES OF DEATHS.

TO HIS EXCELLENCY GEORGE WILLIAM FREDERICK, EARL OF CARLISLE, K.G., LORD LIEUTENANT GENERAL AND GENERAL GOVERNOR OF IRELAND. &c.,

MAY IT PLEASE YOUR EXCELLENCY,

We, the Census Commissioners for the year 1861, beg leave to lay before your Excellency the Second Volume of Part III. upon Vital Statistics, containing, together with the Report thereon, the Tables of Deaths returned to us as having occurred in Ireland between the 30th March, 1851, and 7th April, 1861.

REPORT on Tables OF DEATHS.

The Commissioners for 1851 having, in their lengthened Report and Tables upon this Comparison subject, for the ten years ending in 1851, (and which extend over two volumes amounting of Returns to 1.246 pages), entered minutely into this subject, and afforded not only an englysic of the from 1851 to 1,246 pages), entered minutely into this subject, and afforded not only an analysis of the to 1861. then recently past pestilential period, but also given a history of all previous famines and pestilences in Ireland,—it now only devolves upon us to continue those annual bills of mortality for the late decade, and to compare the results with those of the analogous foregoing period.

We have the pleasure to announce that, during the ten years ending upon the date on which the recent Census was taken, Ireland was (with the exception of the sequelæ to the previous calamities and which arrived to 1853) remarkably free from those pestilential constitutions of either a partial or general character, which have affected this country from the commencement of the "Historic Period" to the middle of the nineteenth century of the Christian era. In proof thereof we may, in limine, remark, that while the total deaths of Ireland, for the decennial period ending upon the \*6th of June, 1841, were 1,187,374, and those for the imperfect decade terminating on the \*30th of March, 1851, were 1,361,051, these returned to us for the decade ending on the \*7th of April, 1861, were only 819,768, or 541,283 less than those received for the previous period:—being a decrease nearly equal to 40 per cent. At the same time it must be remarked, that independent of the subsidence of the great epidemics which occurred from 1846 to 1851, an unparalleled emigration from Ireland, amounting, from the 1st of May, 1851, to the 7th of April, 1861, to 1,208,350, has taken place during the period on which it is now our duty to report.

The Tables on pages 1 to 76 consist of those compiled from data furnished by the Sources of various Infirmaries, General, Fever, and Special Hospitals, and Lunatic Asylums of information. the metropolis, and throughout the provinces, the returns from which, furnished upon Forms Hospitals F. 2 and I. 2,† from the records of those Institutions, and based upon medical authority, are presumed to be pathologically correct so far as they go. We have, however, to regret that now, for the third time, it is the unpleasant duty of the Census Commissioners to refer to the insufficiency of the returns from some hospitals with respect to ages, sexes, and causes of death. As stated in our Volume on the "Status of Disease," the public hospitals of Ireland, open at the time of taking the Census, had decreased from 125, which were in operation on the 30th March, 1851, to 104; and the deaths in those institutions had fallen from 73,344 to 19,791; but the number of lunatic asylums had increased from 33 to 39: the deaths therein during the decade ending in 1851 having been 3,018, and

during that ending in 1861, 3,224.

The second source from which information upon this subject was derived was the Work- Workhouses. houses, and Workhouse Hospitals, the masters of which were, under the Census Act both for 1851 and 1861, appointed enumerators. From these Institutions we received, on "Form E." Table III., returns of 148,749 deaths, which will be found tabulated on pages 77 to 116; while for the decennial period ending on 30th March, 1851, the number was 283,765, or nearly twice as many.

The third source from which returns were derived was the hospitals of prisons, convict Prisons. depots, bridewells, and reformatories, for all which the governors were, by law, appointed This information was procured on "Form F," Table II., and is tabulated

+ See Copies of Forms in Appendix.

\* The dates of the respective Census of 1841, 1851, and 1861.

REPORT ON TABLES OF DEATHS.

on pages 117 to 130. The deaths in these Institutions, for the Census period ending 30th March, 1851, amounted to 5,443, and for the period on which it is now our province to report, to only 2,403.

Household Schedules.

Inquests.

The fourth and principal source of our information upon this subject was derived from the questions asked in the 3rd Table of "Form A," the Household Schedule, on which the population was enumerated; and in which Table we required a "Return of the members, visitors, and servants of this family who had died while residing with this family since the 30th March, 1851." Several of the large public institutions, eleemosynary Several of the large public institutions, eleemosynary asylums, and almshouses, &c., of a domiciliary nature, the inmates of which were returned on "A" Forms, likewise made a Return of the deaths which occurred therein, upon the 3rd Table just described.

As stated in the Reports for 1841 and 1851, such returns must necessarily be defective, as they can only be obtained from localized families, in existence at the end of the ten-year period over which the inquiry extends; and the returns, even from such families, must be imperfect, owing to want of memory, indifference, or design. Moreover, in a country in which very remarkable changes have taken place in the movements of the population, consequent on emigration and other causes, it is more than probable that an unusual deficit has occurred during the past decade. On the other hand, it is just possible that a few families who have either migrated to, or returned to Ireland and filled the Household Schedules, at the time of taking the last Census, may have given an account of a few deaths which occurred in these families before such return or migration to Ireland had taken place. It is also probable that many deaths which absolutely took place in hospitals were entered on the Return "A" as having occurred while the persons resided

with the family to which said return appertained.

As an addition and corrective to the returns received on "Form A" as regards violent and sudden deaths, and also for special purposes connected with vital statistics, we continued the investigation commenced in 1841, requiring a return, under an order from the Government, from the Clerks of the Crown, of all inquests held in Ireland, either by Coroners or Magistrates, from 1851 to 1861. The result of this part of the inquiry will be found tabulated on pages 139 to 175, and the special report thereon is given at page 8. The number of inquests for the decennial period ending June 6th, 1841, was 20,334; for an analogous period ending 30th March, 1851, the number was 29,265; and for the recent decade ending 7th April, 1861, it was 26,582. In all cases where the violent or sudden deaths returned on the Household, Hospital, Prison, and Workhouse Forms did not amount to those afforded by the return of Inquests, the number specified on the latter has been adopted in the provincial and general summaries.

We also received a return from the Constabulary authorities showing the number of sudden or violent deaths,—amounting to 470,—upon which inquests were not held (see page 176); this amount, however, is somewhat defective, as the return for the year 1852

could not be procured.

SECTION I.—REPORT UPON THE DEATHS IN HOSPITALS AND SANITARY INSTITUTIONS.

DEATHS IN HOSPITALS and Sani-TARY INSTI-TUTIONS.

In the Census Report for 1841 an attempt was made, for the first time in this country, to tabulate and present, in a medico-statistical form, all the deaths which were returned, as having occurred in the various Hospitals and Sanitary Institutions in Ireland during the ten years previous to that date. From the novelty of the inquiry, and from the manner in which many of the registers of these hospitals were kept, that return was somewhat defective; yet the number of deaths afforded therein amounted to 40,457, exclusive of those which occurred in gaols.

For the ten years ending when the Census was taken in March, 1851, the number of deaths in all the general hospitals, infirmaries, fever, lock or venereal, and lying-in hospitals, and lunatic asylums, was 76,362. On the present occasion it is our duty to report that for the same class of institutions the number of deaths returned to us as having occurred between the 30th of March, 1851, and the 7th April, 1861, was only 23,015, being somewhat less than a third of the number afforded by the returns for the former decade—a fact to be accounted for by the subsidence, about the year 1852, of the sequelæ of the great pestilential epidemics which preceded the date of the former Census, and the very healthy condition of the country since that period.

Having already, in Volume I. of this part of the Census Publications reported at length upon the diminutions and alterations which have taken place in the various sanitary and eleemosynary institutions and prisons of Ireland, during the decade over which this inquiry extends, it now only remains to compare the death returns of 1861 with those

of 1851, and to analyse the causes of mortality for the former period.

General Hospitals.—Amounting in number to twenty, afforded a return of 6,648 deaths

General Hospitals.

-4,310 males and 2,338 females—or altogether 465 more than were returned in 1851, a circumstance to be accounted for by the fact that, prior to that date, a large number of those who might otherwise have been under treatment in general hospitals, were labouring under infectious or epidemic diseases in fever hospitals and workhouses. The changes which have taken place in these institutions since 1851 have been, as already stated in our Report on the Status of Disease, the closing of the Maison de Santé and the opening of the Adelaide Hospital, and the Pension Medicale in Dublin, and of the Mercy Hospital in Cork city; and the conversion of the old Fever Hospital, at Queenstown, in the county of Cork, into a General Hospital.

DEATHS IN TABY INSTI-

General Hospitals.

In 1851, the proportion of the sexes was nearly the same as on the present occasion, 54.2 females to 100 males. The deaths increased annually from 1852, when they amounted to 667, to 1860, when they reached 706. According to seasons, Winter and Spring afforded the most, and Summer and Autumn the least mortality, as also occurred in the former decade.

Table I., page 2, shows, by localities, the amount and causes of deaths in the General Hospitals of Ireland. Table II., page 6, shows the mortality by ages, sexes, and diseases, the ages being given in single years from birth to the end of the fourth year, and in quinquennial periods up to 90. The five-year period under which most deaths (696) were registered was "40, and under 45;" whereas, in 1851, the principal mortality in this class of institutions occurred during the age period "20 and under 25," and after that from "40 to 45." Table III., page 10, shows the deaths by years, seasons, and diseases already referred to.

The diseases received into these institutions are both of an acute and chronic character, (but mostly of the latter), and the deaths occurred in the following numerical order (which is nearly the same as in the returns for 1851):—consumption, 844; dropsy, 552; bronchitis, 502; burns and scalds, 362; fever, 352; and disease of heart, 312. critical and minute analysis of the diseases in General Hospitals is here unnecessary, as it will be considered in connexion with that of the total deaths afforded by the general

summary of Ireland on pages 210 to 219.

Infirmaries.—Amounting to 34 in number, or one for each county in Ireland—with the Infirmaries. exception of Waterford, where the Leper Hospital occupies its place, and the counties of Wicklow and Tipperary, and the city of Cork, in each of which there are two;—have afforded 4,831 deaths; while for the previous decade, the number was 6,064;—a fact to be accounted for by the greater health of the community, and the decrease of the

population during the decade we have just passed through.

In 1851 the proportion of females to 100 males was 46.8, and in 1861 it was 46.2. With the exception of fever, which, as an infectious disease, is not admissible, the causes of death in the county infirmaries very much resemble those in the general hospitals; and on the present returns the most numerous have been—dropsy, 626; consumption, 560; burns and scalds, 262; bronchitis, 225; fractures, 186; wounds, 175; injuries of head, 168; inflammation of lungs, 166; and disease of heart, 164. The age-period at which most deaths occurred in the County Infirmaries of Ireland was "20 and under 25." The four Tables of deaths in Infirmaries (see pages 16 to 28) give by localities, their amount and causes, by ages, sexes, years, and seasons, from the 30th March, 1851, to the 7th April, 1861.

Fever Hospitals.—Whereas, in 1851 there were returns received from 344 Fever Hos-Fever pitals of either a permanent or temporary nature, there were but 54 institutions of this Hospitals. nature in Ireland during the recent decade. The deaths returned to us from these institutions, for the ten years ending April 7th, 1861, were 5,933, or 3,252 males and 2,681 females, while for the preceding decade (1851) the number of deaths returned from the Fever Hospitals of Ireland was 58,059. Although established for the reception of patients labouring under fever, different diseases of an infectious nature are occasionally received into these institutions, and many deaths occur from other affections than fever. among the foregoing 5,933 deaths, 4,323 occurred from fever, while 188 were attributed to inflammation of the lungs, probably typhoid pneumonia; 187 to small pox; 170 to bronchitis; 98 to scarlatina; 72 to consumption; 66 to dysentery; 63 to hydrocephalus; and the remainder to other diseases incidental to any condition of life.

The age-period at which the greatest number of patients died in Fever Hospitals was from "15 to 25." The deaths therein are given in five Tables (pages 30 to 46), which show their amount by sexes and for provinces, counties, cities, and towns; likewise the years and seasons; and the ages in combination with the years and seasons, at which

they occurred.

Special Hospitals.—These are of three classes,—Lying-in, Venereal or Lock, and Ophthal-Special mic; they amount together to 12, and are located in the Metropolis, the cities of Cork, Limerick, and Waterford, and the town of Relfast, Kingstown, New Ross, and Wexford. viz.:—

erick, and Waterford, and the town of Belfast, Kingstown, New Ross, and Wexford, viz.:—

The Lying-in Hospitals from which of turns were received are five less than those specified Lying-in the Census of 1851; those of the Cork (South District), and Youghal, and also the Hospitals.

Deaths in HOSPITALS AND SANT-TARY INSTI-TUTIONS.

Lying-in Hospitals.

Venereal Hospital.

Ophthalmic Hospital.

Lunatic Asylums. Anglesey, and South-Eastern and Western, in the city of Dublin, having been discontinued: while the Maternity or Maison de Santé, situate in the city of Dublin, was established in 1859.

The deaths in Lying-in Hospitals during the past decade, as shown by Tables I., II., III., and IV., on pages 48 to 51, amounted to 2,347, or 598 less than were afforded by the returns for 1851. Of these deaths, 372 were of mothers, and 1,975 of children, including 1,430 The principal diseases of which the parturient females died were—puerperal fever, 72; peritonitis, 41; convulsions, 20; uterine hæmorrhage, 26; phlebitis, 25; and ruptured uterus, 22; while in 39 cases the return of the cause of death was "childbed" The age at which most females (102) died in childbed was from 25 to 30 whereas in 1851 it was from 30 to 35. According to years, 1857 and 1854 were the most fatal; and by seasons, spring produced the greatest mortality, and autumn the least, as also occurred in the returns for the ten years ending in March, 1851. Among those not still-born the principal causes of infantile mortality were—debility, 161, and convulsions, 118.

The Lock or Venereal Hospital in Dublin is the only institution of this class at present in Ireland. The deaths therein, as specified in the four Tables on page 52, amounted to 31 all females—of whom 14 were between 20 and 25 years of age. St. John's Lock Hospital in Limerick was closed in 1849.

St. Mark's Ophthalmic Hospital in Dublin city afforded a return of one death from disease of brain.

Lunatic Asylums.—The changes which have taken place in Lunatic Asylums since the Report thereon in 1851, as expressed in Vol. I. of this Part, are as follow:—At page 70 of the Status of Disease it is stated, that at the time of taking the Census of 1851 there were only 33 institutions of this class—17 public and 16 private; whereas, at the time of taking the present Census, owing to several changes and many additions, there were 39-18 public, 20 private, and 1 at Lucan, which is both public, and private. The Tables for Lunatic Asylums, showing by localities, the ages, sexes, years, and seasons, as well as the amount and causes of the deaths which occurred therein from 30th March, 1851 to 7th April, 1861, are set forth upon pages 54 to 64. The number of deaths in these Institutions amounted to 3,224-1,758 males and 1,466 females-being 206 more than was returned for the decade ending in 1851; a fact to be accounted for by the increase of these Institutions since the previous inquiry. The number of deaths returned in 1841 was 2,778.

The principal diseases recorded by the officers of these Institutions as the immediate cause of death have been-consumption, 613; infirmity, debility, and old age, 540; paralysis, 258; epilepsy, 222; apoplexy, 193; dysentery, 191; marasmus, 137; and disease of brain, unspecified, 122. As might be expected, the class of diseases to which most deaths were attributed was that of the brain and nervous system, amounting to 839. Next in proportion are diseases of the respiratory organs. Suicide was committed in 29 instances. and maniacal starvation occurred in 22

These Tables of the diseases to which lunatics and idiots are liable, are of great interest in the investigation of the proximate and the remote causes of death in such persons, and they bear a great similitude to those published in 1851. The age-period at which most deaths occurred was from 40 to 45, as was also shown by the returns for 1851; but the two foregoing quinquennial age-periods, 30 to 35 and 35 to 40, were also very high. The year in With respect to seasons—spring, summer, and which most deaths occurred was 1860. winter were nearly alike in amount of mortality; but autumn showed a remarkable immunity in this respect, an observation which was also made in reviewing the returns for 1851.

From page 66 to 76 will be found a summary of the four Tables of deaths in Hospitals and Sanitary Institutions, showing, by classes, ages, sexes, years, and seasons, their amount and causes. The total number of deaths in the foregoing hospitals and sanitary institutions, as already stated, was 23,015.

Section II.—Report on Deaths in Workhouses and Workhouse Hospitals.

DRATHS in Work-Houses and Work-HOUSE HOS-PITALS.

Summary

of deaths in Hospitals.

> The four Tables, showing by localities, the number and causes of deaths, and the ages, sexes, years, and seasons at which such occurred, are displayed from page 78 to 116. According to the returns for 1851 the number of deaths in workhouses and workhouse hospitals amounted to 283,765, while upon the present occasion they only number 148,749, or a little more than one-half of the former amount. These Tables exhibit, by diseases and sexes, and in counties and cities for each of the four provinces, the amount of mortality in each of the 163 workhouses in Ireland. In the returns for the decade ending in 1851 the proportion of sexes was only 93.5 females to 100 males, while upon the present occasion the absolute numbers are 70,232 males and 78,291 females, being in the proportion of 89.7 of the former to 100 of the latter—a circumstance that might be expected from the altered condition of the country during the past decade.

> The numbers of inmates in the Irish workhouses, in 1851 compared with 1861, have been set forth in our Report on The Status of Disease at page 78.

Table I., from page 78 to 107, both inclusive, affords by sexes, the diseases from which

the inmates of each individual workhouse, in every county, city, or town in Ireland, died. It also shows the date of opening each workhouse, from the 24th April, 1840, when the South Dublin Union Workhouse was opened,\* to 3rd December, 1853, at which latter date the Workhouse of Bawnboy Union, in the County of Cavan, first received inmates. On pages 106 and 107 will be found a Provincial Abstract, showing the amount and causes of the deaths specified in the table referred to.

IN WORK-HOUSES and Work-HOUSE HOS-PITALS.

Localities, Sexes, and

In Table II., extending from page 108 to 111, are presented the deaths in workhouses, by diseases, sexes, and ages; and from it we learn, that out of 148,749 before specified, the Diseases. class of epidemic diseases afforded the greatest number, viz., 41,357, or nearly 31.1 per cent. Epidemic of the deaths from all specified causes, and with regard to sexes the proportion was 91.3 males Diseases. to 100 females; while in 1851 the deaths from the same class of diseases in workhouses amounted to 132,900, or 59.1 per cent. of the total; and the proportion of the sexes was 94.3 females to 100 males. The principal cause of death among this class was fever, from which 14,181 deaths were returned. The deaths from this disease in workhouses gradually decreased from 3,218 during the 276 days of 1851, to the year 1859, when the number was only 593; a slight increase was shown, however, in the returns for 1860, the number in that year being 688. According to seasons, the greatest mortality from fever was in summer, whereas in the previous epidemic period the largest number of deaths from this disease occurred in spring. The deaths returned from dysentery amounted to 11,349, and from diarrhoea to 8,070. As in the case of fever, deaths from these causes gradually decreased in number during all the years of the decade, with the exception of the year The chief mortality from dysentery and diarrhoa occurred in summer and spring, which were almost equal, and the least in autumn-a fact which, although contrary to popular opinion, was also remarked upon in analysing the returns for the decade ending in 1851. The next diseases included in the epidemic class for which the largest numbers were returned were—measles, 1,751; and small-pox, 1,118. The number of deaths from the causes just specified forms a very striking contrast to the mortality arising from these diseases in the decade ending in 1851: the deaths from dysentery and diarrhoa then returned were as many as 79,526; from fever, 34,644; from measles, 8,943; and from small-pox, 5,016.

The class of diseases coming next in numerical order is that for the respiratory organs, Diseases of in which were tabulated 34,274 deaths-15,995 males, and 18,279 females, being in the the Respiraproportion of 87.5 males to 100 females. The disease furnishing the largest number of tory Organs. these deaths was consumption (17,027), being 4,953 in excess of the number returned in 1851 from these institutions. The disease showing the next greatest amount of deaths was bronchitis, which also furnishes a larger number than was returned for the previous decade, the relative numbers being 10,855 in 1861, and 8,476 in 1851. Deaths, however, attributed to inflammation of lungs, and to "chest affection" unspecified, were more numerous in the returns for 1851 than in those for 1861, the number for the former being 3,719, and for the latter 1,028; and in 1861, the deaths from these diseases being 2,986 for the former, and 950 for the latter. The total number of deaths from this class of diseases in 1851 was 27,341, being 6,933 less than that already stated (34,274) as having been returned in 1861. The year 1853 afforded the largest number of deaths in this class of disease; and with regard to seasons, spring was the most fatal, and autumn the least, the number of deaths in summer and winter being nearly equal. A similar distribution of the deaths as to seasons appears in the Tables for 1851.

The next class of diseases of greatest numerical importance, on account of its mortality, Diseases of is that which groups together a certain number of sporadic diseases, technically defined as "Diseases of uncertain seat," and affording a return of 20,684, or 8,785 males, and 11,899 Seat. females, being in the proportion of 73.8 of the former to 100 of the latter; whereas in the returns for 1851 for this class of diseases the sexes were nearly equal, the actual numbers being 11,900 males, and 11,778 females. In this class of diseases, 14,313 deaths were attributed to infirmity, debility, and old age, viz., 5,587 males, and 8,726 females. In 1851, the number of deaths assigned to these causes was 18,887, the sexes being very nearly equal. During non-pestilential periods these are the affections most likely, from the ages and condition of the inmates (next to those of the epidemic class and of the respiratory organs), to form the bulk of the mortality in Workhouses and Workhouse Hospitals. Among this class also, spring afforded the largest number of deaths, and autumn the least; and this was likewise the case in 1851.

Diseases of the digestive organs come next, with regard to numbers, in 1861, viz., 18,241 Diseases of deaths—8,697 males, and 9,544 females, being in the proportion of 91.1 of the former to Digestive 100 of the latter; whereas, in 1851, the deaths from diseases of this class exceeded those Organs. tabulated in the class of diseases of uncertain seat. In 1861, the disease which afforded the largest number of deaths in this class, was marasmus, from which 9,674 were returned, the

<sup>\*</sup> The old House of Industry, in Cork, was used as a Workhouse from March, 1840, to December, 1841, at which latter date the present Workhouse at Cork was opened.

Causes unspecified.

Ages.

sexes being very nearly equal, viz., 4,869 males, and 4,805 females. The disease next in numerical order in this class was dropsy, 5,468-2,275 males, and 3,193 females, being in the proportion of 71.2 males to 100 females. In the returns for 1851 also these two diseases afforded the largest number of deaths in this class. The total number of deaths belonging to this group in the Tables for 1851 was 26,638, or 8,397 more than on the present occasion—a fact to be also attributed to the difference in the class of workhouse inmates.

The next most fatal class of diseases in workhouses was that of the brain and nervous system, the deaths amounting to 11,146, 2,024 more than were returned in 1851, the proportion of the sexes being nearly equal. The most frequent causes of mortality were convulsions, paralysis, and disease of the brain, unspecified. As might be expected, the seasons exercised but little influence upon this class of affections, and not being of an

epidemic nature, there was but little annual variation in its numbers.

As in the returns for 1851, the deaths from diseases of the locomotive organs are the next most numerous, amounting to 2,125, or 649 in excess of those returned for 1851, during which period, as already stated, the prevalent epidemics swallowed up all minor affections, and swept away the weak, ailing, and infirm of every class and at all ages. The sexes in this class are nearly equal, and it is not ever likely to be influenced by seasons, or to present much difference one year compared with another.

Amongst the remaining specified causes of death in workhouses are diseases of the circulating organs, the deaths from which amounted to 2,099, or 957 more than were returned for the decennial period ending in 1851—a fact to be chiefly attributed to an increase in the return for disease of heart from 818 in the Census of 1851, to 1,661 in the past decennial period. This is not so much owing to any greater prevalence of cardiac disease, as to the circumstance of improved pathological and diagnostic knowledge, by which—carried perhaps a little too far—symptoms of failing powers in the centre of the circulation, or what is usually termed a "weak heart" during the progress of disease, is set down as the original or remote cause of death.

The diseases of the tegumentary system afforded a return of 1,284 deaths, of which the chief number were attributed to ulceration, 909-an item presenting a remarkable coincidence with the returns for 1851. Ulceration of the surface of the body, although inducive of mortality, is seldom an immediate cause of death. Purpura and scurvy, of which there was an epidemic during the pestilential period between 1846 and 1851, continued on into the decade upon which it is our duty to report, and afforded a return of 110 deaths, of which 16 occurred during the 276 days of 1851, and 21 in the year 1853. The return of 178 from lepra and other skin diseases depends altogether on the authority of the Medical Officers of workhouses.

The deaths from diseases of the urinary organs amounted to 570, in the proportion of Urinary and 36.4 females to 100 males, and deaths from diseases of the generative organs to 508, or 5 males to 503 females; the principal deaths in this class being of 272 women in childbirth, and 162 from cancer of the womb. In 1851 the deaths in this class were 304.

Of the deaths which occurred in workhouses from violent or sudden causes, and amounting to 824, or 139 more than those returned for the decennial period ending in 1851, the sexes were in the proportion of 82.3 females to 100 males, and the most frequent specified causes were—burns and scalds, 311; wounds, 143; and starvation, 116. Of this last number 41 instances occurred during a portion of the year 1851, and 22 in the year 1852; or, both inclusive, amounting to more than one-half of the total number of persons received into Irish workhouses in such a state of prostration from want of proper food as induced the Medical Officers of these institutions to enter upon their registries, as direct cause of death, For the decade ending in March, 1851, the number returned under this head was 333. Nine deaths from starvation were returned for 1853; in 1854, there were 11; in 1855, as many as 13; and from that period to the time of taking the present Census but 20. Of the 116 deaths attributed to starvation, 33 occurred in spring; 32 in winter; 31 in summer; and 20 in autumn. In 155 instances the return of violent or sudden deaths from workhouses, was "accidental unspecified"—the remainder being susceptible of classification under some of the headings given in the tabular forms for this class.

In 15,637 instances of deaths in workhouses the causes thereof were not specified, many of the circumstances attending which deficiency have been set forth in the notes to the Tables of the deaths in these institutions.

Table II., showing, by ages, the deaths in Workhouses and Workhouse Hospitals, enables us to form an opinion as to the ages at which most deaths occur in these institutions. Out of the total 148,749 deaths in workhouses, 15,380 were of children under twelve months old, and 27,951, including the foregoing, were of those who had not attained their fifth year. After that age the rate of mortality gradually decreased in quinquennial periods from "5 and under 10" to "25 and under 30," after which period it again rose between "30 and 35," but fell again considerably in the next quinquennial period, and then rose from "40 to 45," and fell from "45 to 50," to rise, however, in the succeeding period and fall in that

next following. Had this information been received from the public at large, from whom, as it is well known, statistical returns are magnified at particular age-periods, these statements might be questioned; but as the probable age of each workhouse inmate is known to the authorities of these institutions, the foregoing facts present us with material for HOUSE HOS-

DEATHS. IN WORK-HOUSES AND WORK-PITALS.

speculation as to the general laws of mortality, as affecting particular life-periods.

In the quinquennial age-period from "55 to 60," the deaths returned from the Irish workhouses for the decade upon which we are reporting, amounted to 5,165, and in that Ages. following—from "60 to 65"—the number increased to 14,586; and an almost similar peculiarity has been returned for the two subsequent age-periods: the same circumstance was remarked in the ages given in the returns for 1851. The number of deaths from 70

to 75 was 10,379.

As regards the years, a gradual decrease of mortality has taken place from 1851,— Years. when, including the deaths returned for the whole of that year, and which amounted to 41,936,—down to the year 1859, when they amounted to only 8,204. They rose, however, slightly again in 1860.

According to seasons, the deaths in workhouses were in the following order for the Seasons. decade ending in April, 1861:—in spring, 45,694; in summer, 42,363; in winter, 34,041; and in autumn, 25,509. This low rate of mortality in autumn may be accounted for, in part, by the paucity of workhouse inmates, the mildness of that season, and the plentiful supply of food. The same order of mortality, according to seasons, appertained to the decade ending in March, 1851.

Section III.—Report on Deaths in Prisons and Prison Hospitals.

When the Census of Ireland was taken on the 30th March, 1851, the number of Deaths in prisoners confined in the different gaols, convict depots, bridewells, police stations, and Prisons AND penitentiaries was 15,609; the number of committals during the decade ending at that date was 668,053; the receptions into hospital amounted to 88,962; and the deaths were 5,443, in the proportion of 19 females to 100 males. On the present occasion it is our pleasing duty to report that, when the Census was taken on the 7th April, 1861, there comparison were but 4,702 persons in prison, of whom 183 were debtors and 374 untried prisoners, of Returns for 1851 and the sexes being 48.5 females to 100 males—all the circumstances regarding which have 1861. been already set forth at page 118 of our Report upon the Status of Disease, presented to Parliament during the past Session.

Prison Hospitals.

In the voluminous Report upon the Prisons and Prison Hospitals in 1851, the Census Commissioners entered at great length into the subject of the committals, the ratio of receptions into hospitals, and the ratio of deaths to receptions,—circumstances warranted by the peculiarity of the epoch upon which they had to report, but which do not upon the present occasion call for special investigation.

The deaths in Prisons and Prison Hospitals, amounting to 2,403, (of which number 38 were the children of prisoners,) have been set forth in four Tables, extending from page 118 to 130, and which show by localities, ages, sexes, years, and seasons, their amount and causes from 30th March, 1851, to 7th April, 1861:—the proportion of the sexes being 19 females to 100 males, or similar to that in the returns for the previous decade.

As in 1851, the prisoners in the various gaols, convict depots, &c., were enumerated by the several Governors and keepers thereof upon Forms K, and the deaths therein were

shown upon Forms F, Table II., as already stated at page 1 of this Report.

The causes of death among the 2,403 persons—2,019 males and 384 females—who died Causes of in prison during the ten years upon which it is our duty to report, present a propor- Death in tionate as well as a remarkable absolute difference from those returned for the previous Prisons. During many of the years of that latter period the epidemics of fever, dysentery, and diarrhœa, which spread with such intensity, and proved so fatal, throughout every district of the land, extended into our Prisons, overcrowded during that great "epidemic constitution" by persons committed to prison for crimes consequent upon the wide-spread famine which devastated the country. During that period the number of deaths from epidemic or contagious diseases was 2,823, while for the recent decade, those appertaining to the same class, are but 474. In the former period 1,171 persons died of fever in the prisons of Ireland, and during the latter but 149. On the present occasion the deaths from diseases of the respiratory organs, form the great bulk of the mortality in gaols, and amount to 1,001, of which number 774 were attributed to consumption. Of the remaining classes of "sporadic" diseases, there is but little to report as peculiar to gaol mortality, the greater number of the deaths having been caused by the ordinary affections to which the inhabitants of this country are liable—viz., scrofula, 164; dropsy, 60; apoplexy, 43. It is stated in the Returns, that 10 deaths were caused by starvation and 4 by "delirium tremens," while 221 arose from "infirmity, debility, or old age." Nineteen persons were executed—18 males and 1 female—being 78 less than those returned for the decade ending in March, 1851, when there were 91 males and

Digitized by GOOGIC

DEATHS IN Prison HOSPITALS.

6 females; and 178 less than those returned for the decennial period ending in June, Prisons and 1841, when the numbers were 188 males and 9 females. Suicide was committed in 16 instances, being two less than the number returned for the previous decade.

According to ages, the greatest number of deaths during any quinquennial period

Ages, Years, occurred between "20 and 25," when they amounted to 570. and Seasons.

According to years, there was a gradual decrease of mortality, from 493 in the year 1853, to 66 in 1860.

As in the Returns for the Census of 1851, the spring quarter presented the greatest number of deaths, and autumn the least, in the Irish prisons, upon which we have just reported.

Section IV.—Report on Deaths in Charitable Institutions.

DEATHS IN CHARITABLE Institu-TIONS.

In the first volume of this Part of the Census Reports we entered (page 112) at some length into the subject of charitable or eleemosynary institutions intended for the reception and permanent maintenance of the distressed, sick, aged, or infirm, and consisting, for the most part, of the various asylums, alms-houses, penitentiaries, and institutions of a like nature existing in Ireland at the time of taking the last Census, and the inmates of which then amounted to 2,087.

In the Census period ending in 1851, the deaths in these institutions amounted to 700, the sexes being in the ratio of 90.2 females to 100 males; and on the present occasion to 915, in the proportion of 88.7 females to 100 males. This increased mortality in these institutions, as now reported on, may be attributed to a more accurate and special enumeration thereof, as deducted from the general enumeration of the country, and also to a slight increase in their number.

Causes of Death.

An analysis of the causes of death in these institutions gives a result which accords with popular opinion on such subjects. Deaths from diseases of the respiratory organs amounted to 224 out of the 915 specified above; and of these, 172 were attributed to consumption, and 22 to bronchitis; only 9 died of fever; in 47 instances the cause of death was stated to be paralysis; in 65, cancer; in 33, disease of heart; and in 198, "infirmity, debility, or old age."

The ages at which death occurred were from the youngest admissible to the highest age-period given in the table. The great majority of deaths were of persons 60 years

old and upwards.

According to years, 1854, 1857, and 1859 were the most fatal. As regards seasons, winter afforded the largest number of deaths; and, as in all other instances upon which we have reported, the returns for autumn afforded the least number.

SECTION V.—REPORT ON CORONERS' INQUESTS.

COBONERS' INQUESTS.

We now proceed to analyse and report upon the returns of coroners' inquests furnished to us by the Clerks of the Crown; and which give a return of all the violent, sudden, unknown, or suspicious deaths upon which judicial investigations were held, either by coroners or magistrates, from the 30th March, 1851, to 7th April, 1861, together with the name, sex, date, locality, cause of death, and period of the year when such took place.

The ages of the deceased persons were likewise required in the forms issued from this office, but the answers thereto, upon either the present or the former occasions, were not sufficiently numerous or explicit to warrant their publication. As stated in the Report upon this subject in 1851, that classification of coroners' inquests, contained in Sir William Wilde's letter to the Commissioners in 1841, "was the first attempt made in the British Isles to present, in a collected form, the result of inquests held in cases of unknown,

sudden, or suspicious deaths."

In 1841 the total number of inquests reported upon was 20,334, viz., 15,001 males and 5,333 females; in 1851 the number was 29,265, or 20,866 males and 8,399 females; and for the decade ending upon the 7th April, 1861, the number was 26,582, the sexes being 18,605 males and 7,977 females, or in the proportion of 42.9 of the latter to 100 of the former. The tabular abstracts of deaths on which inquests were held, are given by counties. cities, and towns, in four provincial summaries, and one for the country at large, extending from page 140 to 175. As this is a subject which has been already reported upon at considerable length upon two previous occasions, and as we have adopted the nomenclature and arrangement employed in 1841 and 1851, it now only devolves on us to institute a comparison of the returns made for the past decade with those furnished for the twenty years from 1831 to 1851.

CLASS I .- Deaths caused by Violence, Neglect, Evil Intent or Design.

This class includes murder, infanticide, desertion and exposure, manslaughter, justifiable homicide, injuries inflicted by lunatics, unskilful medical treatment, small-pox inoculation, rape, and poison; or all those deaths which may be included under the general term of Homicides, and which amounting to 3,494 in 1841, and falling to 2,374 in 1851, are now but 1,521. Digitized by Google

Deaths. caused by Violence, Neglect, Evil Intent, or Design.

Murder:—or cases where a verdict of "wilful murder" was returned by the coroner's jury, amounted, according to the Returns for 1841, to 890; according to those for 1851, to 498; while by those for 1861 they were only 166—viz., 139 males and 27 females—or Murder. exactly one-third of the number returned for the previous decade. This important decrease in the actual number of murders, and in their proportion to the population existing at the close of each of the three periods, is shown by Provinces in the following Table:—

CORONERS'

|            |   |            | -             | -        | •                   |                      | J                   |  |  |
|------------|---|------------|---------------|----------|---------------------|----------------------|---------------------|--|--|
|            |   | Nu         | mber of Murde | rs.      | •                   | Number of Murders to |                     |  |  |
| Provinces. |   | 1841.      | 1851.         | 1861.    | 1841.<br>1 in every | 1851.<br>1 in every  | 1861.<br>1 in every |  |  |
| Leinster,  |   | 240<br>387 | 135<br>171    | 38<br>50 | 8,223<br>6.191      | 12,391<br>10.864     | 38,359<br>30,271    |  |  |
| Ulster,    |   | 96         | 28            | 37       | 24,858              | 71,853               | 51,736              |  |  |
| Connaught, | • | 167        | 164           | 41       | 8,496               | 6,159                | 22,271              |  |  |
| Total,     |   | 890        | 498           | 166      | 9,185               | 13,157               | 34,933              |  |  |

By this summary it will be seen that the province of Connaught had the greatest number of murders in proportion to its population, according to the Returns for 1851 and 1861the ratio in the former being 1 in every 6,159 of its inhabitants; and in the latter, 1 in 22,271. According to the Returns received for 1841, Munster had the greatest actual number of murders that was returned for any of the Provinces during the three periods, being 387, or 1 in every 6,191 of its inhabitants. Ulster exhibited the greatest immunity from this class of crime for each of the three periods, but had a greater proportionate number of murders, according to the Returns for 1861, than by those for 1851. On the total of Ireland, the number of murders, according to the Returns for the decade ending in 1841, was 1 in every 9,185 of the inhabitants; in that ending in 1851, it was 1 in every 13,157; and in that ending in 1861, 1 in every 34,933. These calculations have been made on the population existing in Ireland at the close of the decade over which the murders extended, which we have considered sufficiently approximate for the sake of comparison. That portion of the year 1851 included in the recent decade, and the years 1853 and 1856, were those in which the largest number of murders was committed in Ireland during the period on which it is now our duty to report. As might have been expected, the seasons of winter and spring—being more favourable from the length of the nights to conceal the design of the assassin—afforded the largest number of cases in which a verdict of wilful murder was returned by a coroner's jury. Of those deaths, 133, or 113 males and 20 females, were returned from the rural, and 33, or 26 males and 7 females, from the civic

The number of persons executed during the decade ending in 1841, was 197; but 97 Executions. in that ending in 1851, and only 19 during that on which we now report. The proportionate number of executions to verdicts, by coroners' juries, of wilful murder was, according to the returns for 1841, 1 in every 4.5; for 1851, 1 in every 5.1; and for 1861, 1 in every 8.7.

Infanticide: - which in 1841 afforded a return of 620 deaths, and in 1851, only 340, Infanticide. now shows a total of 394, the sexes being 214 males and 180 females, or in the proportion of 84 of the latter to 100 of the former. The years 1856 and 1857 were those in which the greatest number of these deaths occurred, and the seasons of spring and summer show the largest amount of mortality from this cause. With regard to districts, 160 were returned from the rural and as many as 134 from the civic; showing a much larger proportionate number to the population for the latter than for the former.

Desertion and Exposure.—Deaths from this cause, which differs but little, in its moral Desertion aspect, from the crime immediately preceding, amounted in 1841 to 314; had increased in and Expo-1851 to 508; and have in 1861, fallen to 291—viz., 155 males and 136 females, or in the sure. proportion of 88 females to 100 males. The years which furnished the largest number of deaths from this cause were 1854 and 1858; and the seasons in which these deaths were most prevalent were spring and summer. Taking infanticide and desertion and exposure together, the total of Ireland afforded a return of 685, being 685 per annum, or 1 in every 8,466 of its population in 1861; the province of Leinster, afforded 218, or 1 in every 6,686; the province of Munster, 192, or 1 in every 7,883 of its inhabitants; that of Ulster, 185, or 1 in every 10,347; and the province of Connaught 90, or 1 in every 10,146. The town of Galway, the city of Dublin, Queen's county, and the counties of Dublin, Kilkenny, Tipperary, Kildare, Westmeath, and Fermanagh, show the largest proportionate number to the population; and Wicklow, Louth, and Kerry show the least number in proportion There were not any deaths from these causes returned from the to their inhabitants. city of Kilkenny, nor from the towns of Belfast or Drogheda.

It is worthy of remark that while the general proportion of sexes is at birth 100 females to 105 males, the sexes of the murdered or deserted children, and who may be presumed to have been all illegitimate, were 100 females to 116 males. In the general infantile

Cordinado,

mortality of Ireland the deaths under one month, were in the ratio of 100 females to 123 males.

Man-slaughter.

Manslaughter:—amounting, according to the returns in 1841, to 1,466, decreased between that period and 1851 to 814, and still further during the last decade to 490, in the ratio of 20 females to 100 males, or nearly similar to the proportion of the sexes in 1851. The years which afforded the largest number of deaths from this cause were 1853, 1856, and 1857; and according to seasons winter stood highest; 363 of these deaths were returned from the rural districts and 127 from the civic. The proportionate number of deaths from this cause in Ireland during the decade, calculated on the population of 1861, was 1 in every 11,834. The province of Leinster afforded a return of 95, or 1 in every 15,344; Munster, 186, or 1 in every, 8,137; Ulster, 113, or 1 in every 16,940; and Connaught, 96, or 1 in every 9.512 of its inhabitants.

Justifiable Homicide.

Justifiable Homicide.—The returns of death under this heading received for 1861 present only 4 cases, all males, 1 of which was received from the province of Leinster, and the remaining 3 from that of Ulster. The number of deaths attributed to this cause in the inquest returns received for the ten years ending in 1841 was 80; and that for the succeeding decade ending on the 30th March, 1851, was 36.

Injuries by Lunatics.

Injuries by Lunatics.—Deaths from this cause, which amounted in 1841 to 21, and in 1851 to 10, appear by the returns received for 1861 to number 11, the sexes being 3 males and 8 females. Seven of these deaths were returned from the civic districts, and 4 from the rural.

Unskilful Medical Treatment.

Unskilful Medical Treatment.—All deaths caused by improper medical treatment or want of skill in the attendants, being indictable offences, were tabulated under this heading. They amounted by the returns for 1841 to but 18; increased during the decade ending in 1851 to 22, and have still further increased during the past decade to 26, or 15 males and 11 females. Eight of these deaths occurred in the province of Leinster, 6 in that of Munster, and 12 in Ulster. Nineteen deaths from this cause were returned from the rural districts, and 7 from the civic.

Inoculation with Small-pox.

Inoculation with Small-pox.—As many as 20 deaths, 7 males and 13 females, have been returned as having occurred from this cause during the decade on which it is our duty to report—7 in Leinster, 2 in Munster, 2 in Ulster, and 9 in Connaught. This fully demonstrates the necessity for the recently passed Act, 26th and 27th Vic., cap. 52, entitled "An Act to further extend and make compulsory the Practice of Vaccination in Ireland."

Rape.

Rape.—The returns for the decade ending in 1841 afforded 9 deaths consequent on violence used in the commission of this crime, or of such injuries inflicted on females as induced subsequent disease and death. On the present occasion, as was the case in 1851, we have only to record one death from this cause, which was entered on the return of coroners' inquests received from the county of Leitrim, and occurred in the month of December, 1854.

Poison.

Poison.—Deaths attributed to this cause, and tabulated in this class, were those in which poison was administered with malicious intent. The number of deaths returned in 1851 under this head was 28; whereas in the returns received for the decade ending in 1861 there have been only 9 cases of death resulting from this cause, 4 males, and 5 females; of which six deaths were returned from the province of Ulster, 2 from Munster, and 1 from Leinster, and all occurred in the rural districts.

Causes unspecified. Unspecified.—Cases in which the cause of death was not specified amount to 109—74 males, and 35 females—being one in excess of the number returned in 1851, but differing much in the ratio of the sexes, which were for the latter period 59 males to 49 females. Under this heading have been registered those deaths of unknown persons whose bodies exhibited marks of violence, and upon which inquests had been held. The years for which the largest number of deaths have been tabulated under this heading during the past decade are 1854, 1858, and 1860. Seventy-nine of these deaths occurred in the rural, and 30 in the civic district.

Class II.—Suicides.

Suicides.

The returns of inquests received for the decade ending in 1861, afforded a return of seven means resorted to by suicides to end their existence—viz., hanging. drowning, stabbing and cutting, poison, gunshot wounds, suffocation, and fall from a height; the deaths from all which amounted to 645; besides which 112 cases were returned of suicides, the means adopted being unspecified, making in all 757, or 547 males and 210 females, being in the proportion of 38 females to 100 males. The seasons in which the greatest number of suicides was committed were summer and spring; and the least, autumn and winter. The months in which deaths of this nature most prevailed were April, July, and March; and those in which the least number of such deaths occurred were December, February, and November. The years which afforded the largest number of deaths in this class of violent or sudden deaths upon which Coroners' inquests were held were 1854, 1859, and 1860.

With regard to the number of suicides, the provinces range as follows:—Ulster, 286, or in the proportion of 1 in every 6,693 of the population in 1861; Leinster, 240, or 1 in every 6,074; Munster, 147, or 1 in every 10,296; and Connaught, 84, or 1 in every 10,871. The proportionate number of suicides to the total population of Ireland, was 1 in every 7,660. Of this class of deaths, 485 occurred in the rural districts, and 272 in the civic, being in the proportion of 1 in every 9,672 of the inhabitants of the former, and of 1 in every 4,072 of those of the latter.

CORONNA' INQUESTS.

The number of deaths tabulated in this class in the Census of 1841 was 755, or 474 males and 281 females, and in that of 1851, 841, or 573 males and 268 females; thus, taking the movement of the population into account, affording a remarkable similarity in the total number in this class according to the returns for 1841, and those for the past decade. A considerable difference, however, is observable in the relative number of the sexes for the two periods, the proportion of females to 100 males being in the former 59; and in the latter, as already stated, only 38.

Hanging.—The number of suicidal deaths returned from this cause in 1841 was 231— Hanging. viz., 145 males and 86 females. In 1851 it was 214, or 146 males and 68 females; and in 1861, 220, or 160 males and 60 females, being in the proportion for the latter date of 37.5 females to 100 males. In 1861, 151 of these deaths were returned from the rural districts, and 69 from the civic; 91 were returned from the province of Ulster, 64 from Leinster, 43 from Munster, and 22 from Connaught. Of the 60 females who adopted this mode of self-destruction, as many as 25 were returned from the province of Ulster, 20 from that of Munster, only 9 from Leinster, and but 6 from Connaught.

Drowning:—deaths from which numbered 151 in the decade ending in 1851, or 3 more Drowning. than were returned for the former decennial period, amounted, according to the returns received in 1861, to 115, or 64 males and 51 females. The seasons which afforded the greatest number of suicides from this cause were summer and autumn. Forty-eight of these deaths were returned from the province of Ulster, 29 each from Leinster and Munster, and only 9 from Connaught. Eighty-five were returned from the rural districts, and 30 from the civic.

Stabbing and Cutting.—It was remarked in 1851 that this form of suicide had greatly Stabbing increased since 1841, the number of deaths from that cause in the latter period having and Cutting. been only 74, and 147 having been returned for the former. We have on the present occasion to report a still further increase, the number of suicidal deaths of this nature appearing on the Coroners' inquest returns being 158, or an increase of 11. As in 1841 and in 1851 the male sex largely preponderated, the number of males returned in 1861 being 121, and of females only 37. Sixty-nine of these cases were returned from Leinster; 50 from Ulster; 24 from Munster, and 15 from Connaught. Ninety-nine instances of deaths from injuries thus self-inflicted, occurred in the rural districts, and 59 in the civic.

Poison.—Sixty-four cases—38 males and 26 females, were returned from this cause for Poison. the period ending in 1861; of which 34 occurred in the rural districts, and 30 in the civic. No less than 37 of these cases were returned from the province of Ulster, being in the proportion of 1 in every 51,736 of its inhabitants in 1861; 15 from Leinster, or 1 in every 97,176; 9 from Munster, or 1 in every 168,173; and 3 from Connaught, or 1 in every The number of suicidal poisonings returned in 1841 was 68, and in 1851 the deaths from this cause were 69.

i ished.

Gunshot wounds.—This means of self-destruction was resorted to in 67 instances, 66 of Gunshot which were males, and, as in 1851, only 1 female. Twenty-two of these suicides Wounds. were committed in the spring season, 15 in summer, 14 in autumn, and 16 in winter. Thirty-seven of these deaths occurred in the rural districts, and 30 in the civic, being, as in 1841 and in 1851, more for the civic than for the rural, in proportion to their respective populations.

Suffocation.—Deaths from this cause, which numbered as many as 20 in 1841, fell to 7 Suffocation. in 1851, and are on the present occasion only 6, the sexes being equally divided. Five of these deaths occurred in Ulster, and 1 in Connaught. The rural districts furnished 3, and

the civic a like number. The precise mode of self-destruction has not been stated.

Fall from a Height.—This mode of suicide was adopted in 15 instances—11 males and Fall from a 4 females, being 14 less than were afforded by the returns for 1851. Thirteen of these Height. cases were returned from the civic districts, and only 2 from the rural; six of these deaths

occurred within the city of Dublin.

Unspecified.—In 112 cases the particular means of death resorted to by the suicide was Unspecified. unspecified in the Inquest Returns-viz., 84 males and 28 females. These deaths were pretty equally distributed over the years and seasons. Seventy-four of them were returned from the rural districts, and 38 from the civic. The number of deaths tabulated under this head in 1851 was 152, and in 1841 it was 167. It is to be regretted that the Inquest Returns do not afford the ages of suicides.

Coroners' Inquests. Class III.—Accidental Deaths, caused without design or intent.

Accidental
Deaths
caused without Design
or Intent.

Drowning.

The number of deaths included under this heading in 1841 was 8,072, in 1851 it was 12,717, and on the present occasion it is 10,981—viz., 7,923 males and 3,058 females, being in the proportion of 386 females to 100 males.

Drowning.—From this cause 2,410 deaths were entered on the inquest returns furnished for the decade ending in 1841, 3,033 on those for 1851, and on those for 1861 there were returned 3,016, or 2,332 males and 684 females; being in the proportion of 29 females to 100 males, the total number thus appearing remarkably approximate to that returned in 1851, on which occasion, however, the proportion of sexes was 363 females to 100 males.

The seasons in which most deaths from this cause took place were summer and autumn, and the months those of July and August. The years in which most accidental deaths from drowning occurred were 1852, 1856, and 1859. Of these deaths, 2,203 were returned from the rural districts, and 813 from the civic. From the province of Leinster were returned 990 cases, or 1 in every 1,472 of its inhabitants in 1861; from Ulster 907, or 1 in every 2,110; from Munster 693, or 1 in every 2,184; and from Connaught 426, or 1 in every 2,143.

Burns and Scalds. Burns and Scalds:—the deaths from which amounted according to the returns for 1841 to only 532, increased in 1851 to 1,580, and during the decade ending in 1861 still further increased to 2,046—viz., 936 males and 1,110 females, being in the proportion of 84 males to 100 females. 1,453 of these deaths were returned from the rural districts, and 593 from the civic; 901, on nearly one-half, occurred in the province of Leinster, 670 in Ulster, 332 in Munster, and 143 in Connaught. Winter afforded the largest number of deaths, as might have been expected from the fact of persons being generally more confined to the house and, therefore, more constantly in the vicinity of the immediate or the remote cause of these accidental deaths, during that season. The years in which most of these deaths occurred were 1855, 1858, and 1859.

Suffocation.

Suffocation.—Deaths from suffocation have been divided in the tables with which we are at present dealing into four heads—viz., suffocation unspecified, which afforded a return of 400, or 263 males and 137 females; suffocation by limekilns, which was the cause of death in 101 instances—96 males and 5 females; suffocation by foul air, from which we find by the returns that 35 persons came by their death, of which number 27 were males and 8 females; and lastly, suffocation by a crowd, which caused the death of one male.

The seasons in which most of these various deaths occurred were spring and winter, and the years which afforded the largest returns were 1851 and 1852. Of these deaths, 392 were returned from the rural districts, and 145 from the civic, making a total of 537

deaths from the four headings above enumerated.

The number of deaths entered on the inquest returns for the decade ending in 1841 as having been caused through suffocation by limekilns was 43, and in 1851, 226: the larger number for the latter period being doubtless attributable to the numbers of the destitute and homeless, who, during the famine period, sought shelter and warmth at limekilns, and, having fallen asleep, were killed by the pernicious influence of carbonic acid gas.

Crushed.

Crushed.—In the inquest returns received for the decade ending in 1861, were recorded the deaths of 1,009 persons, 788 males and 221 females, being in the proportion of 28 females to 100 males, who came by their death through being "crushed." Of these, 178 (128 males and 50 females) were crushed by machinery; as many as 466 (354 males and 112 females) by wheeled carriages; 109, or 79 males and 30 females, by falling of masonry; 102 (95 males and 7 females) by falling of banks of earth in quarries, sandpits, and railway embankments; and in 154 cases (132 males and 22 females) the entries in the returns were "crushed," without any further information on the subject. The number of deaths registered under this heading in 1841 was 761, and in 1851 it was 686; thus showing an increase between 1851 and 1861 of 323, the majority of which occurred through injuries from wheeled carriages, probably the result of the generally increased traffic in the metropolis and the larger towns.

Falls.

Falls.—Deaths from this cause have been divided into four heads—viz., Falls from a height, which afforded a return of 359 deaths, 302 males and 57 females; falls from cliffs, 18, or 16 males and 2 females; falls from horses or cars, 478, or 426 males and 52 females; and falls unspecified, amounting to 290, or 236 males and 54 females; making a total of 1,145, or 980 males and 165 females—the sexes being in the proportion of 16.8 females to 100 males. Of the deaths from this cause, 770 were returned from the rural district, and 375 from the civic. The province of Leinster afforded a return of 374; Munster, 357; Ulster, 344; and Connaught only 70. The number of deaths registered under this heading in 1851 was 1,105.

Railway Accidents. Railway Accidents.—As might have been expected from the increase in the mileage of railways since 1851, a much larger number of deaths have been returned for the recent decade. In 1851 only 76 deaths were recorded as having occurred from this cause, whereas

in 1861 we have received a return of 174 deaths, or 154 males and 20 females. of these deaths (151 males and 19 females) were caused by trains coming into collision, or by persons being overrun, probably at level crossings; and in 4 instances, 3 males and Railway 1 female, the accident from which death ensued was caused by the persons leaping off the Accidents. train while in motion. Taking, however, into consideration the fact that upwards of 1,598 miles of railway are now in operation in Ireland, this mortality of only 17.4 per annum is absolutely and relatively, with other countries, remarkably small.

CORONERS' Inquests.

Starvation.—The number of deaths registered under this heading, from the returns of Starvation. coroners' inquests, was 272, viz., 180 males and 92 females; a number but small when contrasted with that returned for the previous decade, when the deaths from a similar cause amounted to 2,148.

According to seasons, the deaths occurred as follow:—in spring, 117; in summer, 69; in autumn, 35; and in winter, 51; and the years in which the greatest number of deaths, which coroners' juries found to have been caused by starvation occurred, were the first three Of these deaths, 130 were returned from Munster, or 1 in every 11,643 of the population in 1861; 64 from Leinster, or 1 in every 22,776; 48 from Connaught, or 1 in every 19,024; and 30 from Ulster, or 1 in every 63,808. 209 of these deaths occurred in the rural districts, and 63 in the civic.

Exposure and Cold.—Four hundred and ninety-five deaths attributed to this cause were Exposure judicially investigated during the decade ending in 1841; 805 during that ending in 1851; and Cold. and 408 in that ending in 1861—viz., 286 males and 122 females, being in the proportion of 42.7 females to 100 males. As stated in 1851, "the greater number of these inquests were held on bodies found dead and believed to have died from the general effects of exposure when the persons were in a weakened condition."

Exhaustion.—Under this head have been registered 97 deaths—viz., 64 males and 33 Exhaustion. females. Of these deaths, 65 occurred in the rural districts, and 32 in the civic. The number of deaths attributed to this cause in the coroners' inquest returns for the ten years ending on 30th March, 1851, was 145.

Poison.—Accidental deaths attributed to this cause in the returns of coroners' inquests Poison. for the decade ending in 1841, amounted to only 68; whereas for that ending in 1851 there were 175, and on the present occasion there are 152, viz., 97 males and 55 females. One hundred and four of these deaths occurred in the rural districts, and 48 in the civic.

The description of poison used has not been stated.

Killed by Animals.—Two hundred and thirty-nine deaths have been registered under this Killed by heading-viz., 191 males and 48 females. The years which afforded the largest number Animals. of deaths from this cause were 1852 and 1859. Of these deaths, 73 occurred in the summer season, and a like number in autumn. The returns for the decade ending in 1841 attributed 214 deaths to this cause, and those for that ending in 1851 showed 202.

Gunshot Wounds.—Deaths caused by the careless use of fire-arms, and recorded under Gunshot this heading, amounted, according to the returns for 1841, to but 79; by those for 1851, Wounds. to 182, and by the returns for the present decade, to 179, or 160 males and 19 females. One hundred and fifty-three of these deaths occurred in the rural districts, and 26 in the civic. According to seasons the largest number occurred in winter; and the years 1852 and 1857 afforded the most deaths from this cause.

Injury of Head.—To this cause were attributed 114 deaths, viz., 100 males and 14 Injury of females; the number returned in 1851 being very similar—viz., 102 males and 15 females. Head. Seventy-four of these deaths occurred in the rural districts, and 40 in the civic.

Fracture.—The deaths of 36 persons—viz., 26 males and 10 females, were attributed to Fracture. this cause. Only 13 of these cases occurred in the rural districts, while 23 were returned from the civic. In 1851 the number of deaths entered under this head was 25.

Explosion of Gunpowder.—According to the returns for 1841 and 1851, 33 persons were Explosion of killed by the explosion of gunpowder during each decade; but the returns for the past Gunpowder. decade attribute only 19 deaths to this cause—viz., 14 males and 5 females.

Eating Improper Food.—Under this head have been registered 13 cases—viz., 7 males Eating Imand 6 females, being two more than were afforded by the returns for 1851. Seven of proper Food. these deaths took place during the summer season. Six of them occurred in the rural districts, and 7 in the civic. The precise nature of the food partaken of was not stated.

Lightning.—From this visitation of Providence, 52 deaths occurred during the past Lightning. decade—viz., 41 males and 11 females. Thirty-one of these deaths occurred in the summer season, 16 in autumn, and 5 in winter. In the month of August there occurred 15 of these deaths, in June, 11, and in July, 10; 45 took place in the rural, and 7 in the civic districts. According to provinces, the largest number of these deaths (23) was returned from Ulster; 10 each from Leinster and Munster, and 9 from Connaught. The deaths registered under this head in 1841 were 28, and in 1851, 25.

Fright.—The deaths of seven persons—4 males and 3 females—were ascribed to this Fright. cause, 3 of which occurred in summer, 1 in autumn, and 3 in winter. All these cases

CORONERS' INQUESTS.

Accidental

occurred in rural districts. In 5 cases out of the 7 the verdict was founded on medical evidence. In the returns for 1851 the number of deaths attributed to this cause was 5.

Unspecified.—1,466 deaths, or those of 1,176 males and 290 females, were entered on the Unspecified. coroners' inquest returns as "accidental," without any description of the accident which caused death, the sexes being in the proportion of 24.7 females to 100 males. In 1851 the number returned in this class as "unspecified" was 1,697, or 1,315 males and 382

#### Class IV.—Natural Causes.

Natural Causes.

In this class are included those deaths of a sudden or suspicious character, on which coroners' inquests were held, and a verdict of "Death from natural causes" returned. The number of deaths entered in this class for the past decade is 10,374, or 6,972 males and 3,402 females, being in the proportion of 48.8 females to 100 males. The diseases to each of which more than 200 deaths were attributed are the following:—Apoplexy and paralysis, 1,201, or 866 males and 335 females; disease of heart, 1,035, or 697 males and 338 females; hæmorrhage, 461, or 323 males and 133 females; still-born, 452 (270 males and 182 females), of which number, 270 were returned from the rural district, being in the ratio of 1 in every 17,375 of the inhabitants in 1861, and 182 from the civic district, or 1 in every 6,087; epilepsy, 262, or 159 males and 103 females; and consumption, 244, or 210 males to 34 females, showing a remarkable disparity in the proportionate number of the sexes. Various other diseases were assigned as the cause of death, which will be found in the General Abstract, pages 170-1; but we regret to say that in 5,454 instances—viz., 3,604 males and 1,850 females, the description of disease which caused death was not given, the entry in the returns being "Natural causes" or "Visitation of God."

The number of deaths registered in this class in 1841 was only 5,417, or 3,774 males and 1,643 females; in 1851 the number was 10,426, or 7,457 males and 2,969 females.

#### Class V.—Immoderate use of Ardent Spirits.

Immoderate Use of Ar-

During the decade ending in 1861 Coroners' inquests were held on the bodies of 891. Use of Ardent Spirits. persons, 756 males and 135 females, whose deaths were attributed to intemperance. Of these deaths, 718, or 603 males and 115 females, were caused by intoxication; 144, or 129 males and 15 females, by intoxication and exposure; and 29, or 24 males and 5 females, by delirium tremens. The seasons in which most deaths from intemperance occurred were spring and winter; and the years 1852, 1853 and 1854 afforded the largest annual returns. of deaths from this cause.

> According to provinces, these deaths were returned as follows:—From Ulster, 382, or 1 in every 5,011 of its population in 1861; from Munster, 272, or 1 in 5,565; from Leinster, 155, or 1 in every 9,404; and from Connaught, 82, or 1 in every 11,136. From the rural districts were returned 574, or 1 in every 8,173 of the inhabitants thereof, and from the civic, 317, or 1 in every 3,494. The number of deaths tabulated in this class in 1841. amounted to 1,129, or 950 males and 179 females, and in 1851 to 782, or 626 males and 156 females.

#### Class VI.—Cause of Death uncertain.

Cause of Death Uncertain.

In this class are included those cases in which the verdicts were:-No. 1, "found drowned," 990, or 707 males and 283 females; No. 2, "found dead," 652, or 402 males and 250 females; No. 3, "cause not known," 379, or 258 males and 121 females; and also 37 cases, or 18 males and 19 females in which no verdict was returned; altogether making a total of 2,058, or 1,385 males and 673 females. The seasons in which most of these inquests were held were spring and summer. Of these deaths, 1,324 occurred in the rural districts, and 734 in the civic. The returns for 1841 afforded a total of 1,467 deaths in this class, or 991 males and 476 females, and those for 1851, 2,125, or 1,463 males and 662 females.

Unknown Infants.

At the foot of each table of inquests, from page 142 to 175, will be found the total of "unknown infants," the circumstances of whose deaths formed the subject of judicial inves-The inquests on this class in the returns for 1841 amounted to 1,669, in those for 1851 to 2,004, and in those for the present occasion to 1,866.

Medical Evidence.

In 16,524 instances out of the 26,582 inquests held during the decade ending on the 7th April, 1861, medical evidence was obtained. Those cases in which the juries arrived at a conclusion without medical evidence were as follows—viz., 130 instances of deaths attributed to violence, neglect, evil intent or design, 274 to suicide, 5,249 to accidents caused without design or intent, 3,292 to natural causes, 288 to immoderate use of ardent spirits, and 825 where the verdict was "cause of death uncertain." In 263 instances where inquests were held upon unknown infants, the verdict of the jury was arrived at without medical evidence.

In 23 cases of deaths caused by violence, neglect, evil intent or design, in 5 of suicide, in 39 cases of accidental death, in 20 where death was attributed to natural causes, in 2 where it was ascribed to intemperance, and in 6 cases where the jury returned the cause of death "uncertain," the inquests were held by Magistrates.

CORONERS' INQUESTS.

#### VIOLENT OR SUDDEN DEATHS ON WHICH INQUESTS WERE not HELD.

An abstract, showing the number of sudden or violent deaths which occurred in Ireland from March 30th, 1851, to April 7th, 1861 (with the exception of the year 1852, for which the returns were not forthcoming) and on which Coroners' inquests were not held. will be found on page 176. This abstract has been compiled from information taken from the Reports made by the Constabulary to the Inspector-General of that Force. total of the deaths so returned was 470—viz., 339 males and 131 females, being in the proportion of 38.6 females to 100 males; 404 of these deaths occurred in the rural, and 66 in the civic districts.

VIOLENT OR SUDDEN DEATHS ON WHICH Inquests WERE not HELD.

The causes to which these deaths were ascribed are as follows:—To unskilful medical treatment, 1, a male; to suicide, 5-viz., 1 male and 4 females, of which 4 were committed by drowning, and 1 by stabbing and cutting; to accidental death, 298—viz., 225 males and 73 females. Of the accidental deaths, 163 were attributed to drowning, 46 to burns and scalds, 2 to suffocation, 19 to the persons having been "crushed," 34 to falls, 7 to cold and exposure, 5 to poison, 5 persons were killed by animals, 4 deaths were caused by gunshot wounds, 3 by injuries of head, 2 persons were choked, 5 were killed by lightning, and in the remaining 3 cases of accidental death, the cause was unspecified. were ascribed 137 deaths—viz., 93 males and 44 females; to immoderate use of ardent spirits, 4—viz., 3 males and 1 female; and in 25 cases the cause of death was reported "uncertain," of which number 21 (13 males and 8 females) were found drowned; 1 male was found dead; and in 3 instances—2 males and 1 female, the entry in the report was "cause unknown."

Of the 470 cases included in these Reports of the Constabulary, 141 occurred in spring, 117 in summer, 96 in autumn, and 116 in winter.

#### Section VI.—Report on General Mortality in Ireland.

Sir William Wilde having, in his letter to the Census Commissioners for 1841, written REPORT OF an exordium to this portion of the subject, extending back as far as the year 1831, and the Commissioners for 1851, having continued the investigation commenced ten years MORTALITY. previously, it now only remains for us to follow up the bill of mortality for Ireland under-Previous taken by the two previous Census Commissions, and continue it thence down to the 7th Inquiries. April, 1861. A Bill for the General Registration of Deaths (Act 26 Vic. cap. 11) having become the law of the land on the 1st January, 1864, the subject of the mortality of this portion of the United Kingdom, presuming the returns to be faithfully given, will no longer remain a matter of calculation or speculation, but be reduced to mathematical demonstration, and thus afford a means of testing the authenticity as well as the accuracy of the returns of deaths given decennially and afforded by those householders in Ireland from whom the Census forms relating thereto were received in 1841, 1851, and 1861. Defective as these returns might have been anticipated to be, yet we have reason to believe they nearly approach the truth, and form a basis of comparison one decade and one year with another, as well as with the results of the investigation now commenced, with presumedly surer and more permanent means.

Happily we have not to report upon any great pestilential epidemic affecting either Absence of animal or vegetable life during the period included within the present inquiry. No Epidemics. great national calamity bearing upon vital statistics, epiphitics, or epizootics has taken place; there has not been any general failure in food; and the only movement of the population bearing upon any of the subjects relating to this branch of the Census inquiry, is that of the decrease by emigration, a topic which is treated at length in our General Decrease of Report. It is, however, here necessary to state what that emigration, (so far as known,) Populationand its effects upon the condition of the population of Ireland, have been during the past ten years.

The following table sets forth the population of 1851, and ten following years—the probable increase therein at the rate of 1 birth in every 31 and of 1 death in every 45 of the population; or in round numbers and popularly expressed, an increase of about 1 per cent. per annum over and above the loss by mortality:-

| On | 7th      | April,  | 1861, . | • |   | 5,962,724   | -                                    |                                      | _                                  | . —   | _  |

From this table, which has been calculated on the only reliable data within our reach, it may be seen that the population of Ireland, on the 7th of April, 1861, should have been 5,962,724, whereas, according to the critical investigation made on that date, it only amounted to 5,798,967, thereby showing a deficiency of 163,757. As it is not our province in this part of our publications to deal minutely with the returns of the living, but with those of the dead, we refer to our "General Report" for an explanation as to the probable cause of this difference between the estimated and the actual population of Ireland at the date of taking the Census. This deficiency may, however, in part be here accounted for by—a decrease in the number of births, especially during the early years of the decade, and also during an epidemic exodus—a greater mortality than that returned—and a greater amount of emigration than that recorded in each year.

Annual Decrease of Population.

The deaths forming part of the decrease which has occurred in the population during the decade, it may not be out of place to notice the annual rate per cent. of that decrease, as given in the last column in the table, from which it will be seen that the lowest rate of decrease (0.03 per cent.) was during the 97 days of the year 1861, and that the highest (1.99 per cent.) was during the nine months of 1851; as, however, the drain by emigration generally fluctuated with the seasons, we pass over the portions of the years 1851 and 1861, forming the extremes of the decade, and find that the minimum annual decrease was in 1858, when it was only 0.07 per cent., and that the maximum was reached in 1852, when the decrease amounted to 1.96 per cent.

Estimated number of Deaths, and number returned on Census Forms.

The following summary shows the estimated number of deaths in Ireland at 2 per cent., or 1 in 50, which (except in years of pestilence or distress), is the probable mortality during each year of the decade; the number returned on the various Census forms; and the difference between the two amounts:-

| Years.          | Estimated Number of Deaths at 1 in every 50 of the population. | Number of<br>Deaths<br>returned on<br>Census Forms,<br>in 1861. | Excess of Estimated Number of Deaths over Number returned on Census Forms. | Years.            | Estimated Number of Deaths at 1 in every 50 of the population. | Number of<br>Deaths<br>returned on<br>Census Forms,<br>in 1861. | Excess of<br>Estimated<br>Number of<br>Deaths over<br>Number<br>returned on<br>Consus Forms. |
|-----------------|--|---|--|-------------------|--|---|--|
| 1851 (part of), | 98,286*  | 50,537*   | 47,749*  | 1858,             | 122,200  | 82,005  | 40,195   |
| 1852,           | 128,662  | 80,112  | 48,550   | 1859              | 122,411  | 85,264  | 37,147   |
| 1853,           | 126,433  | 79,883  | 46,550   | 1860.             | 122,299  | 94,349  | 27,950   |
| 1854            | 124,520  | 78,563  | 45,957   | 1861 (part of), . | 32,450±  |   |  |
| 1855,           | 123,235  | 80,416  | 42,819   | (1 //             |  |   |  |
| 1856,           | 122,908  | 77,834  | 45,074   | Total,            | 1,246,003  | 819,768§  | 426,235  |
| 1857,           | 122,599  | 77,104  | 45,495   | ,                 | ,,   |   | ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,  |

From this summary it will be perceived that the difference between the estimated number of deaths during the decade, and the number returned to us on the various Census forms, is as much as 426,235. Large as this difference is, it is not wholly unaccountable, for it must be borne in mind that as the tide of emigration swelled, so our sources of information diminished.

Deaths in families of Emigrants.

We, therefore, present the following summary showing the estimated number of deaths which probably occurred in the families of the emigrants between the 30th March, 1851, and the time of their leaving this country—as in the great majority of instances the entire family removed, thus leaving no trace by which its mortality could be ascertained.

<sup>†</sup> From April 1st to December 31st, 1851. For nine months. ‡ For the first 97 days of 1861.

<sup>§</sup> Including 313, for which the years in which they occurred were not specified.

|| The deaths returned on the Census forms for the 97 days of 1861 exceed the estimated number of deaths by 938, a fact which may be accounted for by the spring quarter of the year being invariably the most fatal.

The calculation of the estimated number of deaths in this summary has been made, as in the foregoing, upon the basis of 1 death per annum to every 50 of the population; and has been taken on the absolute or recorded number of emigrants (but not upon their original number, before reduced by the deaths), as a "set off" against those deaths in their families which may have been furnished to us from the records of hospitals and eleemosynary Deaths in institutions, and some, probably, by those of their families who remained behind and resided in Ireland at the time of taking the Census.

| 1854,  |       |      |                         | .  | 140,555  | 10,541 |         | of), |                         | .  | 17,485†   |         |
| 1855,  |       |      |                         |  | 91,914   | 8,731  | **      | ,,   |                         | - [.   |           |         |
| 1856,  |       |      |                         | .  | 90,781   | 10,440 | Total,  |      |                         | .  | 1,208,350 | 105,499 |
| 1857,  |       | •    |                         | .  | 95,081   | 12,836 | ,       | -    |                         | - 1  | , ,,      | ,       |

Thus it will be seen that 105,499 deaths had probably occurred amongst the families of the emigrants between March 30th, 1851, and the termination of the year of their departure from this country, which (with very few exceptions) were lost to our returns, as those who should have recorded the deaths were in other lands. This reduces the difference between the estimated number of deaths and those returned on the Census forms to 320,736, a difference which, although great, is not matter of surprise, when the only available means for collecting the great bulk of the deaths is considered, and which has already been described -viz., Table III. of the A Form or family schedule, a source of information which, doubtless, miscarried in very many instances through the breaking up of families, the deaths of many who left no relatives to record their decease, the apathy and indifference of some, the antipathy to giving information in others, forgetfulness on the part of many, and in some cases misconception as to the information sought for.

As yet we have no standard of proportionate annual mortality in Ireland, nor can we Annual until the present registration of deaths has been some time in operation, and the mortality

epidemic of emigration has ceased, or considerably lessened.

in Ireland.

According to the Twenty-fourth Annual Report of the Registrar-General for England [1861], the annual death-rate in the chief-towns and civic districts in England and Wales was 2.44 per cent. of the population then presumed to exist, and 1.98 per cent. in the rural, or, both localities inclusive, 2.2 per cent., or 1 in every 45. In Scotland it was 2.06 per cent., or 1 in every 48, in the year 1855; while in other countries in Europe it has varied from 2.11 per cent., or 1 in every 47, in Denmark, to 3.65 per cent., or 1 in every 27, in Lower Austria.

Now, as it is a well-established fact that mortality increases with density of population, and as the rural population of Ireland is to the civic as 81 to 19, and as, except in cases of food-failures and epidemic constitutions (from both of which the past decade has been free) many circumstances conduce to render Ireland more healthy than England, or even Scotland, we consider that the death-rate in this country cannot be very much higher than

2 per cent., or 1 in every 50 of its inhabitants.

In support of this we quote the following from the original Report of Sir William Wilde, Assistant to the Census Commissioners, on this subject, published in the Census volume for 1841, on the deaths returned for a period unmarked by any great change in the population:—" In England, the bills of mortality for many years, and the lately published Sanitary Report upon the condition of the working classes in particular, show us that the ratio of deaths to the living varies from 1 in 64 in the agricultural districts and the open country, as in Herefordshire, to 1 in 28.33 in the densely populated manufacturing towns. To establish, then, a fair analogy between the mortality of the two countries—the proportion of Ireland which is analogous to, and its inhabitants similarly situated with those of the working classes in Herefordshire, Dorset, or Cornwall, the healthy parts of England, on the one hand—and the proportion of this country, or its inhabitants similarly situated with those of Leeds, Manchester, or Liverpool, the unhealthy parts of England, on the other, must be all taken into account." And he arrived at the following conclusion, "that were an accurate registration effected, the proportionate annual mortality would not be found to exceed 1 in 52 or 1 in 53;" a conclusion which was strengthened by the fact that "the superior healthiness, or less mortality in Ireland, arises chiefly from the greater proportion of its rural to its civic district, than the same portions of England."

Report on Tables of Deaths. Before going into detail, we think it right to present the foregoing comparative table of the diseases and mortality returned on the household schedules or from public institutions, for the three decades during which an inquiry was made at the terminal period of each as regards the deaths of the previous ten years.

Analysis of Deaths by Diseases. The following analysis of the various mortal diseases returned to us, will, independent of its intrinsic value, afford by comparison with the returns for 1841 and 1851, matter of interest to the medical historian, the vital statist, and the philanthropist:—

Zymotic or Epidemic, Endemic, and Contagious Diseases.

Small-pox.

No. 1.—SMALL-POX—Variola; in Irish, Bolgach or Galar-breac, the speckled disease, and under several English synonymes, has been known in Ireland since the year of the Christian era, 675. For the ten years preceding the 6th June, 1841, the deaths attributed to this cause amounted to 58,006; in the decennial period, ending on the 30th March, 1851, to 38,275; and thence to the 7th April, 1861, the decade upon which it is now our duty to report, the mortality from this cause had fallen as low as 12,727, or 6,714 males, and 6,013 females, being in the proportion of 89.6 of the latter to 100 of the former. This happy decrease in the Small-pox mortality from 1 in every 20.46 of the deaths registered in 1841 to 1 in every 64, in 1861, shows that those sanitary regulations which have emanated from the Government, or have by parliamentary enactments become the law of the land, have already been attended with a salutary result. At the date of taking the Census in 1851, the number of those in Small-pox bore the proportion of 1 in every 118 of the total sick; in 1861, the proportion was only 1 in 655. According to provinces, the mortality in proportion to the population thereof in 1861 was, in Connaught, 1 in every 310; in Munster, 1 in every 400; in Leinster, 1 in every 465; and in Ulster, 1 in every 669.

Small-pox forms the eighth most fatal disease of the Epidemic class, and the deaths returned from it in 1861 were in the proportion of 1 in every 14.9 of the deaths from this class of diseases. The years for which the greatest number of deaths from this cause was returned, were 1852 and 1856. Most of the deaths returned as from Small-pox were of persons under 5 years old; a considerable number (2,171) were returned between the ages of 5 and 10; and comparatively few after that age. Of these 12,727 deaths, 3,817 were returned on the family schedules received from the civic districts, and 7,534 on those from the rural; 258 were returned from hospitals and sanitary institutions, and 1,118

from workhouses.

For a detailed analysis of all the circumstances relating to this disease, and its occasional epidemics, see Report on Tables of Deaths for the Census of 1851, Part V., Vol.

I., pages 421 to 423.

Measles.

No. 2.—Measles—Rubeola; in Irish, Bruitineach, the boiling disease. The first mention of this disease in the Irish medical annals was in the beginning of the sixteenth century, from which date it has more or less prevailed in this country. The number of deaths attributed to it between the 30th March, 1851, and the 7th April, 1861, was 13,231, or 6,666 males and 6,565 females, being in the proportion of 98.5 females to 100 males, thus showing a remarkable similarity in the sexes. The proportion of the sexes in the decade ending in 1851, was 96.3 females to 100 males.

Measles forms the seventh most fatal disease of the Epidemic class—the proportion of deaths being 1 in every 14.3; and in comparison with the total number of deaths registered for the decade, it furnishes 1 in every 62. Of these 13,231 deaths, 24 were returned from hospitals, &c., and 1,751 from workhouses; 4,825, or 1 in every 230 of the population were returned on Forms A received from the civic districts, and 6,631, or 1 in 707 on those from the rural. The returns for 1851 presented a very different result as regards its distribution, the number returned from the civic districts being 1 in every 183 of the population, and from the rural 1 in 391. The years in which this epidemic prevailed most were 1852, 1854, 1859, and 1860. Measles proved most fatal during the very early years of life; the deaths registered under 12 months, 1 year old, and 2 years old were over 2,000 each, in the proportion of 94.5 females to 100 males. After the last-named age, the deaths gradually decreased.

According to provinces, 3,646 deaths from measles, or 1 in every 400 of the population were returned from Leinster; 4,898, or 1 in every 309 of its population, from Munster; 2,909, or 1 in every 658, from Ulster; and 1,778, or 1 in every 514, from Connaught. The returns of the sick in Ireland on the night of taking the Census show that the proportionate number of persons suffering from measles was 1 in 58 of the total sick; in 1851, it was only 1 in 101. The number of deaths returned from this disease for the decade ending

in 1841 was 30,739, and for that ending in 1851, 29,295.

No. 3.—Scarlatina—Rosalia angina maligna; in Irish, Fiabhrus dearg, the red fever, or

This disease, which does not appear to have been known in the British Ruadh, redness. Isles until the beginning of the last century, has greatly increased in fatality during the period embraced within the last three decades, and a chronological sketch of its progress in this country will be found in the Report on the Tables of Deaths for 1851, Part V., Scarlatina. Vol. I. of the Census publications, pp. 424-5; and there is also a lengthened treatise upon it in Sir William Wilde's letter to the Census Commissioners for 1841.

REPORT ON TABLES OF DEATHS.

According to the returns received in 1861, Scarlatina was the second most fatal disease of the Epidemic class; it forms a remarkable contrast to the other great epidemic diseases included therein, which, with the exception of influenza, show a great decrease when compared with the previous decade; whereas Scarlatina shows an increase of 5,556 in a diminished population. The proportion of deaths from Scarlatina to the total deaths in the Epidemic class was 1 in every 7.4, and the proportion to the total deaths from all causes 1 in every 32. In 1851, the ratio to the total was 1 in every 67.

Of the 25,727 deaths returned from this disease, 13,412 were males, and 12,315 females, being in the proportion of 91.8 of the latter to 100 of the former; 8,421 of these deaths were returned on the family schedules received from the civic districts, and 16,618 on those received from the rural; 158 from hospitals, and 530 from workhouses. Upon referring to the returns of 1851, we find that 7,527 deaths from this disease had been returned from the civic, and 11,121 from the rural districts; 167 from hospitals, and 1,356 from workhouses; thus showing that the increased number of deaths from Scarlatina occurred in the rural district, and that the workhouses had comparatively escaped its

ravages during the past decade.

The years in which Scarlatina prevailed most during the decade were 1856 and 1857; and those for which the least number of deaths was returned, 1852 and 1853. The deaths in 1860 were over 300 less than those returned for 1859, and upon the night of taking the Census only 266 cases of Scarlatina were reported; whereas, on the 30th of March, 1851, there were 324 returned. According to provinces, the returns of deaths from Scarlatina afforded the following results:—from Leinster 8,051, or 1 in every 181 of its population in 1861; from Munster, 7,179, or 1 in every 211; from Ulster, 9,031, or 1 in every 212 (in 1851 there were only 3,864 deaths from Scarlatina returned from this province); and from Connaught, 1,466, or 1 in every 623. The age-period at which most deaths from Scarlatina were registered was "Under 5 years," amounting to 14,642; of which number, 2,659 were of infants under twelve months old; 7,153 were of children between 5 and 10 years, after which age deaths from this cause gradually decreased.

The total number of deaths returned from this disease in 1841 was only 7,886, and in

1851, 20,171.

No. 4. Hooping-cough—Pertussis; in Irish, Trioch.—This is the third most fatal Hooping disease of the epidemic class, according to the returns furnished for the past decade; it cough. affords a total of 18,570 deaths, or 8,616 males, and 9,954 females, being in the proportion of 86.6 of the former to 100 of the latter—this ratio being almost identical with that returned in 1851. The proportion of deaths from Hooping-cough to the total number of deaths in the epidemic class was 1 in every 10.2, and the proportion to the total deaths from all causes, 1 in every 44. According to provinces, the deaths from this disease were returned as follows:—4,841 from Leinster, or 1 in every 301 of its inhabitants; 5,155 from Munster, or 1 in every 294; 5,827 from Ulster, or 1 in every 329; and 2,747 from Connaught, or 1 in every 332. With regard to localities, 5,619 were returned on "Forms A" received from the civic districts, or 1 in every 197 of the population thereof; and 11,909 on those received from the rural, or 1 in every 394: 1,034 deaths from this cause were returned from the workhouses, and 8 from hospitals and sanitary institutions.

The deaths from this disease or its complications were almost exclusively those of children, the greatest number being of infants under twelve months old, which amounted to 6,563, in the proportion of 98.3 males to 100 females. After the age-period "5, and under 10," very few deaths were recorded. The years for which most deaths were returned

were 1858 and 1859.

The deaths attributed to Hooping-cough in the returns for 1841 amounted to 36,298;

and in those for 1851 to 26,873.

No. 5. Crour—Cynanche trachealis; in Irish, Tachtum sgornaigh, choking in the throat, Croup. Quinsy.—This, the fifth most fatal epidemic affection, carried off 15,766 persons, 8,664 males, and 7,102 females, being in the proportion of 82 of the latter to 100 of the former. The proportion of females to 100 males in 1841 was 82.9, and in 1851, 80.4. Deaths from this disease bear the proportion of 1 in every 52 of the deaths registered from all causes, and of 1 in every 12 of the deaths in the epidemic class. Of the 15,766 deaths, 4,002 were returned on the household schedules received from the civic districts, and 11,405 on those from the rural; 29 from hospitals, and 330 from workhouses. during the decade in which Croup proved most fatal were 1858, 1859, and 1860. Eleven

REPORT ON TABLES OF DEATHS.

Croup.

Thrush.

Pemphigus.

deaths, all males, were recorded of persons over 10 years of age; 5,250 of the deaths from Croup were of children under twelve months old—the proportion of the sexes being 72 females to 100 males. 4,947 of these deaths occurred in the province of Leinster, or 1 in every 295 of its population in 1861; in Munster, 4,596, or 1 in 329; in Ulster, 3,119, or 1 in 614; and in Connaught, 3,104, or 1 in 294. The total number of deaths returned from this cause in 1841 was 42,705; and in 1851, 23,802. Under the head of Quinsy or Croup were, no doubt, included many other affections of the thorax, and especially Diphtheria, of which there had been many cases, but not amounting to an epidemic.

No. 6. Thrush—Aphtha; in Irish, Galar Beoil, disease of the cavity of the mouth, together To this infantile disease were attributed in the Census with other Irish provincialisms. returns for 1841, as many as 1,480 deaths; 714 deaths in those for 1851; and in those for the decade we are at present dealing with, 275—viz., 129 males, and 146 females, being in the proportion of 88'4 of the former, to 100 of the latter. No variation occurs in the years of the decade to call for any special remarks thereon. Ninety-one of the deaths attributed to this cause were returned from the civic, and 168 from the rural districts, and the remaining 16 occurred in workhouses. The hospital returns did not afford any instance of death from thrush.

No. 7. Pemphigus gangranosus, Pompholyx, mortifying hives; in Irish, Ithcheadh, the eating disorder. This disease, which was so prevalent and fatal in Ireland in former times, has, during the period embraced within the last three decades, been nearly confined to the northern parts of the country; 93 per cent. of the deaths attributed to it for the thirty years alluded to, having been returned from the province of Ulster. The deaths ascribed to this disease in the returns for 1841 were 17,799; in those for 1851, they amounted to 8,347; and in those for the decade ending in 1861, to only 4,828; thus showing a decrease of about 50 per cent., comparing one decade with another. the 4,828 deaths returned in 1861, the sexes were, 2,715 males, and 2,113 females, being in the proportion of 77.8 females to 100 males. An examination of the number of deaths returned annually shows this disease to be of an endemic character.

The great bulk of the deaths attributed to pemphigus (4,315) were returned from the rural districts, while there were but 464 returned from the civic; 48 were recorded on the workhouse returns, and only 1 death from this cause occurred in hospital. lengthened description of this disease will be found in Sir William Wilde's letter to the

Census Commissioners for 1841.

Dysentery.

No. 8. DYSENTERY—Dysenteria; in Irish, Innrumh bronn, a driving forth from the belly; and Rith fola, passing of blood, is said to be one of the most ancient affections recorded in Ireland; and in the Census Report for 1851, Part V., Vol. I., will be found a history of it, stretching back as far as A.D. 365, at which period one of the kings of Ireland is said to have been "much troubled with the bloody flux." Dysentery, well described in the Report referred to as "the sequel of famine, and the concomitant of fever," caused during the years of suffering included within the decade ending in 1851, the large number of 93,232 deaths. Happily, upon the present occasion we have to report upon only 16,581 deaths attributed to this cause, 8,655 males, and 7,926 females, being in the proportion of 91.5 females to 100 males, forming a remarkable contrast with regard to the proportion of the sexes, when compared with the returns for the previous decade, on which occasion the proportion was 75.1 females to 100 males; a fact to be accounted for by the altered condition of the country.

The deaths from dysentery returned on the Census forms for 1851, were in the ratio of 1 in every 15 of the deaths from all causes; in the returns for the past decade the ratio is but 1 in 49. Of the 16,581 deaths returned in 1861, more than one-half occurred

in the years 1852 and 1853, and in the latter nine months of the year 1851.

Dysentery is the fourth most fatal disease in the epidemic class in the returns for the year 1861, it bears the proportion of 1 in every 11.4 of the deaths registered therein.

The workhouse returns afforded the great majority of deaths (11,349) from this disease; 3,259 were returned from the rural district; 1,356 from the civic; and 617 were recorded upon hospital forms. With regard to provinces, 2,921 deaths were returned from Leinster, being in the proportion of 1 in every 499 of its inhabitants in April 1861; 9,010 from Munster, or 1 in every 168; 2,187 from Ulster, or 1 in every 875; and 2,463 from Connaught, or 1 in every 371 of its population. Deaths from dysentery were registered at all ages; but the age-period which proved the most fatal was "from 60 to 65."

No. 9. DIARRHŒA; in Irish this disease is carefully distinguished from dysentery and is termed Teinneas cuirp, also Teinneas-an-bhuilg, sickness of the belly; and likewise Sgaoilteach, looseness. The deaths attributed to this cause in the Census returns for 1851 numbered 41,323; on the present occasion they are but 11,977, or 6,221 males, and 5,756 females, being in the proportion of 92.5 of the latter to 100 of the former. It forms the ninth most fatal affection in the epidemic class, and bears the proportion of 1 in every 15'8

Diarrhœa.

of the deaths registered in it. The proportion of deaths from diarrhæa to the total deaths registered from all causes was 1 in 68. The comparative number of deaths attributed to this disease on the workhouse and hospital returns, in the rural and civic districts and in the provinces, is similar to that for dysentery; and like that disease it caused death at Diarrheea. all ages from the infant to the highest age recorded in the tables. The greatest number of deaths registered in any of the quinquennial age-periods was in the period "under five years old."

REPORT ON TABLES OF

In the Census returns for 1841, deaths from dysentery and diarrhea were registered together. The following is the number of the deaths returned from these two diseases for

each of the three periods:—10,744 for 1841; 134,555 for 1851; and 28,558 for 1861.

No. 10. AGUE—Febris intermittens; in Irish, Fiabhrus creathach, the shaking fever; also Ague. Crith, the shake. The earliest notice of this disease in the medical history of Ireland was at the end of the fourteenth century, from which period it may be considered to have been endemic in the country. Epidemics of intermittent fever have occasionally spread over Ireland from the date just mentioned; but since the year 1829 this country has been comparatively free from them. The deaths returned from this cause on the Census forms for 1841, were 518; on those for 1851, only 294; but on those for 1861, as many as 442; the sexes being 307 males and 135 females, or in the proportion 43.9 females to 100 males, a disparity in the sexes to be accounted for by a fact recorded in the Report on the tables of deaths for 1851, namely, that the great proportion of ague which has appeared in Ireland during the past century was imported from England by the harvest labourers, who were all of the male sex.

The chief portion (319) of the deaths from ague were returned on forms received from the rural districts, and were nearly all of persons belonging to the labouring class; 75 were returned from the civic districts; 38 on the workhouse forms, and 10 from hospitals. The largest number of deaths returned for any year during the decade was that for 1860.

The quinquennial age-period at which most deaths occurred was "from 20 to 25."
No. 11. Сноцева—Cholera Asiatica, Cholera morbus; in Irish, Tonn taosgach agus cram- Cholera. paidhe, purging, vomiting, and cramps. Although not bearing the same name, a disease somewhat similar in character to cholera seems to have appeared in Ireland, A.D. 981, at which period is recorded the prevalence of the "Tregait fithnaisi, the great epidemic colic." But little, however, was known of the disease until the years 1832-3, when no less than 25,378 persons fell victims to its ravages. The decade on which it is now our duty to report has been comparatively free from this scourge, the only outbreak being in the year 1854, which carried off 1,706 persons. Deaths, however, from cholera, have been registered in all the years of the decade, and amount to a total of 3,967, or 2,169 males and 1,798 females—being in the proportion of 82.9 females to 100 males.

As might have been anticipated, deaths from cholera were comparatively more numerous in the proportion of 82.9 females to 100 males.

in the civic than in the rural districts, the ratio for the former being 1 in every 657 of the inhabitants, and for the latter, 1 in every 3,762. With regard to provinces, deaths from this cause were divided as follows:—Leinster, 1,147, or 1 in every 1,271 of its population; Munster, 930, or 1 in every 1,627; Ulster, 1,684, or 1 in every 1,137; and Connaught, 206, or 1 in every 4,433. The total number of deaths attributed to cholera in the returns

for 1841, was 50,769; and in those for 1851, it was 35,989.

No. 12. Influenza—Catarrhus Epidemicus; in Irish, Creatan, a cold; Slaedan, prostration. The earliest notice of this disease in the British Isles is that recorded in the Irish annals under A.D. 1326, since which period it has been occasionally epidemic in Ireland. A chronological record of its visits to this country will be found in the Report on Tables of Deaths for the Census of 1851, Part V., Vol. I., page 432. While the deaths attributed to this disease in the Census returns for 1841 were only 10,575; and in those for 1851, 10,753; the returns for 1861 furnish us with 14,484 deaths, 7,800 males, and 6,684 females; being in the proportion of 85.7 females to 100 males; thus showing an increase of 3,731 in the decade ending in 1861 over that ending in 1851; an increase not to be ascribed to an epidemic of this disease, but rather to catarrhal, bronchitic, and other chest affections having been returned as influenza, which were formerly returned under other headings. Of the 14,484 deaths, 2,201 were returned from the civic districts, or 1 in every 503 of the inhabitants thereof; and 11,167 from the rural, or 1 in every 420 of their population; while in 1851 the deaths were 1 in every 575 amongst the inhabitants of the towns, and but 1 in every 766 of those of the country parts, thus showing that the increase is chiefly in the rural districts.

... The years in which influenza prevailed most during the decade were 1855, 1858, and 1860. Influenza is the sixth most fatal disease in the epidemic class; the deaths from it being in the ratio of 1 in every 13.1 of the deaths registered therein. The proportion to the total deaths from all causes was 1 in every 56.

No. 13. FEVER—Febris, Typhus Hibernicus; in Irish, Fiabhrus, fever; and Teascha, the hot Fever.

REPORT ON TABLES OF DEATHS.

Fever.

The subject of fever has been already so fully treated of in the Census Reports for 1841 and 1851, that it only remains for us here to compare the number of deaths returned on the Census forms for 1861 with those registered for the former periods. deaths from fever returned for the ten years ending in 1841 were 112,072, in the proportion of 86·1 females to 100 males, the mortality from this disease being in the ratio of 1 in every 3.4 of the deaths in the epidemic class of diseases, and of 1 in every 10.6 of the deaths from all causes. During the latter portion of the ten years ending in March, 1851, fever raged to an unparalleled extent in Ireland, having for its victims those who having become destitute and starving through the failure of the potato crop, became an easy prey to its ravages—a history of which will be found recorded in Part V. of the Census Reports for 1851, Vol. I., pp. 433-7. The deaths from this disease during that decade amounted to no less than 222,029, in the proportion of 88.9 females to 100 males, and were in the ratio of 1 in every 2.5 of the total deaths in the epidemic class of diseases, and of 1 in every 6.1 of the total deaths registered from all causes. The Census Returns for 1861 afford a total of 48,315 deaths from fever—viz., 25,404 males, and 22,911 females, being in the proportion of 90.2 of the latter to 100 of the former. These deaths are in the ratio of 1 in every 3.9 of those tabulated in the epidemic class of diseases, and in the proportion of 1 in every 17 of the total deaths registered from all causes.

From the foregoing it may be observed that while the deaths from fever only formed a ratio of 1 in every 3.4 of the deaths registered in the epidemic class of diseases according to the returns for 1841; they increased to 1 in every 2.5 according to those for 1851,

and again fell to 1 in every 3.9 in 1861.

Of the 48,315 deaths, 6,226 were returned from the civic districts, or 1 in every 178 of the inhabitants thereof, in the year 1861; 23,020 from the rural districts, or 1 in every 204 of their population; 4,888 deaths from this disease were returned on hospital forms; and 14,181 on those for workhouses; the deaths of females in the latter predominating over those of males, the sexes being in the proportion of 92.7 males to 100 females.

Of the total 48,315 deaths from fever which occurred during the decade, 5,533 were returned for the nine months of 1851; 7,527 for the year 1852, and 6,143 for the year 1853; after which date a gradual decline occurred up to the year 1860, which showed a slight increase over the preceding year (1859). Taking into consideration the very probable defect in the returns for the earlier years of the decade, it may be assumed that the deaths from fever which actually occurred in the year 1851, and in the years 1852 and 1853, the portion which may be considered the sequel of the pestileutial period immediately preceding, more than equalled the deaths from this disease during the remaining portion of the decade. Fever is the most prevalent and fatal epidemic in this country, and according to the returns for the ten years ending in 1861, may be presumed to have destroyed upon an annual average 1 in every 1,450 of the inhabitants.

According to provinces, 14,851 deaths from fever occurred in Leinster, being 1 in every 98 of its inhabitants in 1861; 17,239 occurred in Munster, or 1 in every 88 of its population; 10,555 in Ulster, or 1 in every 181; and 5,670 in Connaught, or 1 in

every 161.

Deaths from fever were registered at all ages; but, comparing one quinquennial ageperiod with another, the greatest number was registered in that from fifteen to twenty years. In the Report on the Tables of Deaths for the decade ending in 1851, will be found a lengthened record of outbreaks of fever, detailed in the Table of Cosmical Phenomena, Epizootics, Famines, and Pestilences; in which, as well as in the analysis thereof, commencing at page 433, will be found a chronological account of this disease in Ireland, from A.D. 759 to the commencement of the decade upon which it is now our duty to report. With the exception of the sequel of the recent epidemic constitution carried over into the years 1851, 1852, and 1853, Ireland has had an immunity from fever almost unparalleled in the annals of her diseases.

No. 14. ERYSIPELAS; in Irish, *Tene Dhia*, God's fire; and *Tene fiadh*, wild fire. Deaths attributed to this cause were 1,791, or 968 males and 823 females, being in the proportion of 85 females to 100 males. Of these deaths, 377 were returned from the civic and 894 from the rural districts; 171 from hospitals and sanitary institutions; and 349 from

workhouses.

With regard to provinces: 714 were returned from Leinster, being 1 in every 2,042 of the population thereof in 1861; 463 from Munster, or 1 in every 3,269; 480 from Ulster,

or 1 in every 3,988; and 134 from Connaught, or 1 in every 6,814.

The number of deaths entered under the several years included in the decade do not present any difference when compared one with another to lead to the supposition that erysipelas had been epidemic during the decade. The largest number of deaths (237) was returned for the year 1860, but this may be accounted for from the returns having been more accurately filled for that year than for the earlier years of the decade.

Erysipelas.

The deaths of 195 children under twelve months old were attributed to this disease, the sexes being 106 males and 89 females. Deaths at all ages were attributed to erysipelas; but the quinquennial age-period in which most occurred was "under five years old."

On the night of taking the Census, 228 laboured under this disease, being 1 in 333 of the Erysipelas. total sick.

REPORT ON TABLES OF

The number of deaths attributed to this disease in the Census returns for 1841 was 1,232; and in those for 1851, 1,882; the proportion of the sexes in the former period being 73.5, and in the latter 72.5 females to 100 males.

No. 15. Syphilis—Lues Venerea; in Irish, Bolgach Frangcach, French pox, and Olc na Syphilis. mban, the venom of the women. The returns for 1841 afforded only 384 deaths from this disease; those for 1851, an increased number of deaths, amounting to 569; and those for 1861, a still greater number, viz., 745, or 308 males and 437 females, being in the proportion The increase in the number of deaths from syphilis was of 70.5 males to 100 females. attributed in the Report on the Tables of Deaths for 1851, to the means afforded of ascertaining information on the subject through returns received from the several workhouses established in Ireland, subsequent to the returns for 1841 having been received, and the improbability of finding many deaths entered on the Forms A or family schedules, as having occurred from this cause. This observation is fully borne out by the returns received in 1861, for, of the 745 deaths attributed to this disease, 624 were returned on the Workhouse Forms; 85 on the Hospital Forms; and only 8 on the Household Schedules received from the civic district, and 28 on those received from the rural.

Of these deaths from syphilis, 240 were of children under twelve months old, the sexes being equally divided; 39 were of children one year old and under five (17 males and 22 females), and for the age-period, "five and under fifteen," 11, or 2 males and 9 females were returned. Deaths from this cause were registered in all the succeeding quinquennial age-periods, the largest number being that for "twenty and under twenty-five."

The province of Leinster afforded a return of 304 deaths from this disease, being 1 in every 4,795 of its inhabitants in 1861; Munster 299, or 1 in every 5,062; Ulster 107, or

1 in every 17,890; and Connaught 35, or 1 in every 26,090.

No. 16. Нудворновы—Rabies; in Irish, Greim con confaidh, bite of a mad dog; and Hydropho-Ok, venom or poison. The number of deaths returned from this disease was 61, or 47 bis. males and 14 females, being in the proportion of 29.8 of the latter to 100 of the former. Of these deaths, 36 were returned from the rural districts and 14 from the civic. Twentythree of them occurred in the province of Leinster; 19 in Munster; 10 in Ulster; and 9 in Connaught. Deaths attributed to hydrophobia were registered at various ages, the youngest being of one male two years old, and the oldest, a female between eighty and eighty-five. The number of deaths attributed to this cause on the Census returns for 1841 was 31, and on those for 1851, 57.

No. 17. GLANDERS and FARCY—Équinia, Farcinoma; in Irish, Fothach, glanders; Achma Glanders or Eachma, farcy; Cachmaigh, button farcy. Glanders and farcy afforded a return of 173 and Farcy. deaths, or 142 males and 31 females, being in the proportion of 21.8 females to 100 males. Of these deaths, 118 were returned from the rural districts, and 14 from the civic; 20 from hospitals and 21 from workhouses. According to provinces, 87 or more than one-half were returned from Ulster (which province had also in 1851 the largest number of deaths attributed to this disease); 42 from Leinster; 38 from Connaught; and only 6 from Munster, which province had only 5 deaths attributed to this disease in the returns for 1851, out of the 196 returned for the total of Ireland. In the returns for 1841, there were only 11 deaths altogether returned under this heading.

The total number of deaths from zymotic or epidemic, endemic, and contagious diseases, Total of returned in 1861 on the various Census forms designed for the purpose of collecting a Zymotic or return thereof, amounted to 189,660, or 98,937 males and 90,723 females, being in the Diseases. proportion of 91.7 of the latter to 100 of the former. Deaths from this class of diseases were in the ratio of 1 in every 4.3 of the total deaths from all causes, and of 1 in every 3.9 of the deaths from specified causes. Analysing the divisions adopted in Table I., page 210, we find that the deaths which occurred in the civic district from this class of diseases bore the proportion of 1 in every 4.1 of the total deaths in that district from all causes, and of 1 death in every 27.6 of the inhabitants thereof in 1861. The deaths in the rural districts bore the proportion of 1 in every 4.7 of the total deaths therein from all causes, and of 1 death in every 46.3 of their population. Those returned from hospitals and sanitary institutions were in the proportion of 1 in every 3.8 of the total deaths therein from all causes; and those from workhouses were in the proportion of 1 in every 3.6.

According to provinces, 51,239 of these deaths were returned from Leinster, being in

BEPORT OF TABLES OF Дражня.

Total of Zymotic or Epidemic . Diseases.

the ratio of 1 in every 4.8 of the deaths in that province from all causes, and of 1 in every 28.4 of its inhabitants in 1861; 62,700 were returned from Munster, being 1 in every 3.8 of the total number of deaths therein, and 1 in every 24.1 of its population; 49.813, or 1 in every 4.7 of the total deaths therein, and 1 in every 38.4 of its population were returned from Ulster; and Connaught afforded a return of 25,908, being 1 in every 3.9 of the deaths in that province from all causes during the decade, and 1 in every 35.2 of its inhabitants in 1861.

The deaths from the epidemics of fever, dysentery, and diarrhoa, taken together, preponderate so greatly over the other deaths in this class, that the observations already made in treating of them, as to the larger number of the deaths which occurred during the

earlier portion of the decade, are applicable to the whole class.

With regard to the ages of the persons cut off during the decade by this class of disease, 45.1 per cent. were under five years old; 12.8 were five and under ten; 10.8 were ten and under twenty; 6.3 were twenty and under thirty; 4.4 were thirty and under forty; 5.3 were forty and under fifty; 15.1 per cent. were fifty years old and upwards; and of 0.2 per cent. the ages were unspecified.

The number of deaths from this class of diseases returned on the Census forms in 1841 was 381,249, in the proportion of 92.9 females to 100 males; and the deaths returned

in 1851 amounted to 553,801 in the proportion of 87.2 females to 100 males.

Sporadic Diseases.

Sporadic Diseases—or those neither zymotic, epidemic, nor contagious, follow next in succession, the first class of which embraces the deaths from diseases of the brain, nervous system, and organs of sense, as follows:—

Diseases of the Brain and Nervous System.

Hydrocephalus.

No. 18. Hydrocephalus—Meniregia tuberculosa Encephalitis; in Irish, Usgear an Inn-chinn, water on the contents of the head. The number of deaths from this disease returned on the Census Forms for 1841 was 8,997; on those for 1851, the number was 12,429; and on those for the decade on which we now report, 12,153, or 6,963 males and 5,190 females, being in the proportion of 74.5 of the latter to 100 of the former. As was remarked in 1841 and in 1851, deaths from this disease are more frequent in the civic than in the rural district, the deaths returned upon the present occasion from the former being 6,238 (in the proportion of 73 females to 100 males), or 1 in every 178 of the inhabitants thereof; while from the latter there were but 4,804 deaths returned (in the proportion of 75.2 females to 100 males), or 1 in every 977 of its population; thus showing a remarkable difference in the ratio of mortality from this disease to the population of each district. In 1851, also, the proportionate number of females to males was greater in the rural than in the civic district—the number in the former being 80.6, and in the latter 77.5 females to 100 males. One hundred and twelve deaths from Hydrocephalus were returned from hospitals, and 999 from workhouses.

The deaths from this disease were in the proportion of 1 in every 67 of the deaths from all causes, and the number of deaths registered for each year in the decade was very

similar.

Of the 12,153 deaths, 7,428 were of children under five years old, of which number 2,679 were under twelve months old—in the proportion of 69.9 females to 100 males; and 2,566 were of children "five and under ten." Comparatively few deaths were registered from Comparatively few deaths were registered from this disease at the more advanced ages.

From the province of Leinster were returned 5,621 deaths from Hydrocephalus, or in the proportion of 1 in every 259 of its inhabitants in 1861; from Munster were returned 2,584 deaths, or 1 in every 586; from Ulster, 3,368, or 1 in every 568; and from Con-

naught, 580, or 1 in every 1,574 of the population thereof.

Inflammation of Brain.

No. 19. Inflammation of Brain—Cephalitis, Phrenitis, Meningitis, Cerebro-spinal Arachnitis; in Irish, Galar an chinn, disease of head (general term). The deaths from this disease returned in 1841, were, 6,591; in 1851, 5,691, and are on the present occasion, 3,889, or 2,211 males and 1,678 females—being in the proportion of 75.9 of the latter to 100 of the Of these 3,889 deaths, 991 were returned from Leinster, or 1 in every 1,471 of its population; 1,304 were returned from Munster, or 1 in every 1,161; 1,246 from Ulster, or 1 in every 1,536; and 348 from Connaught, or 1 in every 2,624.

Deaths from inflammation of the brain bore the proportion of one in 211 of the deaths

from all causes.

Apoplexy.

No. 20. APOPLEXY—Apoplexia: in Irish, Bedhg, a start or fit; Bas d'aon bheidhg, death by a single start or seizure. Deaths caused by this disease during the decade ending on the 7th April, 1861, amounted to 9,458, or 5,894 males and 3,564 females—being in the proportion of 60.5 of the latter to 100 of the former; the number of deaths returned

in 1841, was 11,185; and in 1851, 12,596—the proportion of the sexes on that occasion

being 55.7 females to 100 males.

Of these 9,458 deaths, 1,887 were returned from the civic district, being in the proportion of 1 in every 587 of its population in 1861; and 6,208 from the rural district, or 1 in Apoplexy. every 756. From the hospital returns were registered 418 deaths attributed to this cause; and from those for workhouses, 945. Deaths from apoplexy were registered at all ages, but the number registered at "sixty and under sixty-five" was greater than that registered for any other quinquennial age-period. The deaths from this disease, in comparison with the total deaths from all causes, were in the ratio of 1 in every 87.

No. 21. Convulsions—Convulsio; in Irish, Feith-chrapadh, contracting of the sinews. Convulsions. From the returns received in 1841 as many as 66,870 deaths were registered from this disease; from those for 1851, but 43,167; and from those received for the past decade, only 30,171, or 17,119 males and 13,052 females—being in the proportion of 76.2 females to 100 males. During the three decades the province of Ulster has shown a comparative immunity from this disease; for the recent decade, the returns for the province of Leinster afforded 11,574 of the deaths from this disease; those for Munster, 9,863; for Connaught, 6,384; and those for Ulster, only 2,350.

Of the 30,171 deaths, 11,616 were returned from the civic districts—being in the proportion of 1 in every 95 of the inhabitants thereof in 1861; and 14,702 from the rural districts, or 1 in every 319. From the hospitals, 153 deaths were returned, and from workhouses, 3,700. Deaths have been attributed to convulsions at all ages; but the great bulk thereof (21,352) were of infants under twelve months old, the sexes being in the proportion of 72.8 females to 100 males. The deaths from this disease were in the pro-

portion of 1 in 27 of the total deaths from all causes.

The following passage, quoted from the Report upon the Tables of Deaths for 1841, may not be considered out of place:-

"The term Convulsions is in numerous instances vague and indefinite; and being so frequently an attendant upon the great majority of infantile diseases (as well as those of youth generally), both of the digestive and nervous systems, the deaths returned under this head must include a vast number of the other diseases of early life, as Dentition, Worms, Water on the Brain, Disease of Intestines, and even some of the exanthemata, as well as Epilepsy, from which it cannot well be separated in extreme youth."

No. 22. Paralysis—Hemiplegia, Paraplegia, Paralysis agitans, Chorea; in Irish, Leath. Paralysis. mharbh, half dead, Crioth, palsy. The deaths from this disease, which were only 7,206 during the decade ending in 1841, and 7,288 during that ending in 1851, increased to 9,846 during the recently past decade, the sexes being 5,509 males and 4,337 females, or in the proportion of 78.8 of the latter to 100 of the former. From the civic districts 1,674 of these deaths were returned, being 1 in every 662 of the population thereof, and from the rural, 4,813, or 1 in every 975; from hospitals, 528, the sexes being 378 males and 150 females (a similar disproportion of the sexes of persons who died in hospitals males and 150 females (a similar disproportion of the sexes of persons who died in hospital of this disease appeared in 1851, when the numbers were 354 males and 121 females); and from the workhouses, 2,831, the sexes being remarkably similar—viz., 1,415 males and 1,416 females. The number of deaths from paralysis entered on the workhouse returns in 1851, was only 1,177—a difference which is to be accounted for, as previously stated, by the fact of the inmates of these institutions having been carried off in such large numbers by diseases of the epidemic class. The quinquennial age-period in which most deaths from paralysis occurred is that "from sixty to sixty-five." Deaths from this disease bore the proportion of 1 in every 83 of the total deaths registered from all causes; in the returns for 1851, the ratio was 1 in every 187.

No. 23. Lockjaw—Tetanus, Trismus nascentium; in Irish, Glas-geill, a locking of the Lockjaw. jaw. Deaths attributed to this disease for the ten years ending on the 7th April, 1861, were 319, or 225 males and 94 females, being in the proportion of 41.8 of the latter to

100 of the former.

Of these deaths, 52 were returned from the civic district, or 1 in every 21,303 of its inhabitants, in 1861, and 103 from the rural, or 1 in every 45,546; 91 were returned on hospital forms, and 73 upon those for workhouses. Of the deaths from lockjaw, 79-47 males and 32 females—were of infants "under twelve months" old; of the remaining deaths, the largest numbers registered in any of the quinquennial periods were those for "fifteen and under twenty," and "twenty and under twenty-five." With regard to provinces, 117 were returned from Leinster; 56 from Munster; 121 from Ulster; and 25 from Connaught. Two hundred and thirty-eight deaths were attributed to this disease in the returns for 1841, and 305 in those for 1851.

No. 24. EPILEPSY—Epilepsia; in Irish, Tinneas-mor, the great or terrible disease; Epilepsy. Talmaidecht, earth sickness, or falling sickness; Tinneas Phoil, St. Paul's disease; Tinneas Eoin Baiste, the disease of St. John the Baptist. In the Census Reports upon the Tables of Deaths for 1841 and 1851 will be found an explanation of the various Irish terms

REPORT ON TABLES OF DEATHS.

REPORT ON Tables of DEATHS.

The number of deaths attributed to epilepsy in the returns for applied to this disease. 1861, was 1,769, or 996 males and 773 females, being in the proportion of 77.6 females to

Epilepsy.

Of the 1,769 deaths from epileptic affection 163 were returned from the civic district, or 1 in every 6,796 of the inhabitants thereof; and 708 from the rural, or 1 in every 6,626; on the hospital returns were recorded 279 deaths; and on those for workhouses, 619, in which the number of females exceeded that of males, the returns showing 322 females and

Deaths from epilepsy were recorded at all ages; the number of deaths of children under five years old being greater than that registered for any other quinquennial period. Compared with the general mortality, epilepsy gives a proportion of 1 in 463. The number of deaths ascribed to this disease in the Census returns for 1841 was 1,030, and in those for 1851, 3,083.

Delirium Tremens.

Insanity.

No. 25. Delirium Tremens—in Irish, Deasca meisge, dregs of drink, and Radh-bhaile meisce, raving from inebriety. The deaths returned on the Census forms for 1841, as having occurred from this cause amounted to 77; on those for 1851 they amounted to 91; and on those for the past decade to 187, or double the number returned for the previous decade, the sexes being 172 males and 15 females. The great bulk of these deaths (144) were returned upon medical authority—viz., 126 upon hospital forms, and 18 upon those for workhouses. The largest number (26) for any annual period was returned for 1852; and the age-periods which proved most fatal were "from thirty to thirty-five;" "from thirty-five to forty;" and "from forty to forty-five." Coroners' inquests were held on 29 of these deaths.

Of the 187 deaths attributed to Delirium Tremens, 109 were returned from Leinster, or 1 in every 13,373 of its population; 39 from Munster, or 1 in every 38,809; 31 from

Ulster, or 1 in every 61,750; and 8 from Connaught, or 1 in every 114,142.

No. 26. Insanity—Mania, Monomania, Dementia, Puerperal Mania; in Irish, Gealtacht, madness from lunar influence; Buile or Mire, madness generally; Dasacht, furious madness; Feith, a cold humour, melancholy. The number of deaths attributed to insanity on the Census forms for 1841 was 1,511; on those for 1851 it was 1,263; and those for 1861 afforded a return of 1,230—viz., 623 males and 607 females, being in the proportion of 97.4 of the latter to 100 of the former. Of these 1,230 deaths, 209 were returned from the civic district, or in the proportion of 1 in every 5,300 of the inhabitants thereof in 1861, and 631 from the rural, or 1 in every 7,435. Fifty deaths from insanity were recorded on the hospital returns, and 340 on those for workhouses.

Deaths from insanity have been registered at all periods of life after 5 years of age, the quinquennial period, "sixty and under sixty-five," having the most. Deaths from this disease bore the proportion of 1 in every 666 of the total number of deaths registered

from all causes.

Of the 1,230 deaths, 345 were returned from the Province of Leinster-being 1 in every 4,225 of its population, in 1861; 378 from Munster, or 1 in every 4,004; 372 from

Ulster, or 1 in every 5,146; and 135 from Connaught, or 1 in every 6,764.

Although a less number of deaths have been attributed to insanity on the Census returns for 1861 than upon those for either of the two preceding decades, the circumstance may be accounted for by the fact that death from maniacal exhaustion is comparatively rare, and that the immediate cause of death among the insane has been stated with greater accuracy in the returns from Lunatic Asylums on the present than on former occasions. It cannot be doubted that more persons died insane during the decade upon which we now report, than in either of the two previous periods, as is proved by the number of lunatics returned at the date of taking the Census in 1851 and in 1861, which is shown in the Status of Disease, Vol. 1 of this part of our publications, p. 56.

Disease of Brain. unspecified.

No. 27. DISEASE OF BRAIN UNSPECIFIED—in Irish, Tinneas Cinn, sickness or lightness of head; Galar Cinn, vapour in the head (old term); Daigh-cluaise, a darting pain through the ear; Sileadh-cluaise, a running from the ear. The number of deaths entered under this heading in 1851 was 1,158; on the present occasion the number is 3,954, or 2,244 males and 1,710 females—being in the proportion of 76.2 of the latter to 100 of the former. Of these 3,954 deaths, 562 were returned from the civic districts—being 1 in every 1,971 of their population in 1861, and 2,032 from the rural, or 1 in every 2,309; 353 were returned upon hospital forms, and 1,007 upon those for workhouses. No sensible variation occurs in the number of deaths returned for each year of the decade, from this or the preceding disease, to call for remark. Deaths were entered under this heading at all ages, but the quinquennial period "under five years" had most registered in it, and of these, 407 were of infants under 12 months old, in the proportion of 73.9 females to 100 males. The deaths entered under Disease of Brain Unspecified were in the ratio of 1 in every 207 of the total deaths from all causes.

The total deaths from diseases of the brain and nervous system amounted to 72,976, or 41,956 males and 31,020 females—being in the proportion of 73.9 females to 100 males. Of these deaths, 26,886 were returned from the Province of Leinster, or 1 in every 54 of the population thereof, in 1861; from Munster, 20,426, or 1 in every 74; from Ulster, Total Deaths 15,565, or 1 in every 123; and 10,099 from Connaught, or 1 in every 90. Of the total from deaths caused by diseases of the brain and nervous system, 23,256 were returned from the Diseases of civic districts, or 1 in every 48 of their populations, and 36,350 from the rural districts, or and Nervous 1 in every 129. We received records of 2,224 on the hospital forms, and of 11,146 on System. those for workhouses.

REPORT ON

Deaths from diseases of the brain and nervous system were in the proportion of 1 in every 11.2 of the total deaths registered from all causes. The number of deaths attributed to this class of diseases in 1841 was 103,705—in the proportion of 74.2 females to 100 males; and in 1851 but 87,071, in the proportion of 72.8 females to 100 males, the prevailing epidemics of that period having swallowed up all other diseases.

### Diseases of the Circulating Organs.

No. 28. DISEASE OF HEART—Morbus Cordis, Carditis, Endocarditis, Pericarditis, Disease of Cyanosis; in Irish, Galar-an-Chroidhe, heart disease; Luas Croidhe, beating of the heart, Heart. The deaths attributed to this cause, which in the returns for 1841 amounted to only 2,015, increased in those for 1851 to 6,481, and in those for the recently past decade to the still larger number of 16,465, or 9,101 males and 7,364 females—being in the proportion of 80.9 of the latter to 100 of the former. Of these deaths, 4,638 were returned from the civic districts, or 1 in every 239 of the inhabitants thereof, and 9,534 from the rural, or 1 in every 502; 632 were returned upon hospital forms, and 1,661 on those for workhouses. This increase in the number of deaths attributed to this affection is not confined to any particular locality, but is spread throughout the country at large—a fact which has been already ascribed (at page 6) to a general increase of pathological knowledge. Deaths from disease of the heart were in the proportion of 1 in every 50 of the total deaths from all causes. They occurred at all the age-periods expressed in the tables, the greatest number registered in any quinquennial period being that for "sixty and under sixty-five."

No. 29. Aneurisma; in Irish, Raobadh cuisleann, rupturing of the pulse. Aneurism. The returns for 1861 afford a total of 180 deaths from this cause, or 7 less than the number returned for the previous decade, the sexes being 139 males and 41 females. The numbers returned for 1851 were 148 males and 39 females; and in 1841 but 63 males and 8 females. In 1861, the civic districts afforded a return of 21, and 20 were received from the rural; 90 were returned upon hospital forms, and 49 on those for workhouses.

No. 30. Vomiting of Blood-Hæmatemesis; in Irish, Urlacann fola, or Sgeathrach fola, Vomiting of vomiting of blood. To this cause were attributed in the returns for 1841 the deaths of Blood. only 75 persons, whereas in 1851 the number returned was 623, and in 1861, 732, or 464 males and 268 females, being in the proportion of 57.7 of the latter to 100 of the former. Of these deaths, 63 were returned from the civic districts, and 603 from the rural; the hospital returns recorded 13 deaths from this cause, and those for workhouses 53. The earliest age at which deaths have been tabulated under this heading is "five and under ten;" the quinquennial age-period, at which most deaths were returned, was that from "twenty to twenty-five." With regard to provinces, 88 of these deaths were returned from Leinster, 131 from Munster, 363 from Ulster, and 150 from Connaught. In 1851 a much larger number of deaths were attributed to this cause in the returns from Ulster than in those from any of the other provinces.

No. 31. Spirring of Blood—Hæmoptysis; in Irish, Sile fola, spitting of blood. Deaths Spitting of from this disease, which is popularly expressed as the "bursting of a blood vessel," Blood. numbered during the past decade 527, or 331 males and 196 females, being in the proportion of 59.2 of the latter to 100 of the former. Of these deaths, 61 were returned from the civic districts and 142 from the rural; 102 were returned upon hospital forms, and 222 on those for workhouses. As in the case of vomiting of blood, deaths were not registered at any age under 5 years: the greatest number in any quinquennial age-period was that for "twenty and under twenty-five." The number of deaths attributed to "spitting of blood" on the Census returns for 1841 was 69, and on those for 1851, 426.

No. 32. Hæmorrhage General or Unspecified—Epistaxis, Melæna, varicose ulcers, accidental bleedings of any kind; in Irish, Cur fola (general term); and Cuishle, disease of the hage, General veins, effects of venesection. Under this head have been registered, as in 1851, all deaths General. from internal and external hæmorrhages from accident or disease, not included amongst the deaths attributed to the three foregoing diseases; they amount to 954 or 593 males and 361 females, being in the proportion of 60.9 females to 100 males. As many as 119 of these deaths were of children under 5 years of age, after which age-period, deaths were

Report on Tables of Deaths.

Hæmorrhage, General. recorded at all ages. The number of deaths tabulated under the head of hæmorrhage general in 1851 was 965, and in 1841 as many as 2,049—a number, the largeness of which was attributed, in the report on deaths in 1851, to less care and minuteness in filling the returns than was observed in the latter period, in consequence of which, diseases which were properly described in 1851 as vomiting of blood, or spitting of blood, were returned in 1841 so indefinitely as to cause the necessity of tabulating them under the head of hæmorrhage general.

Total Deaths from Diseases of the Circulating Organs. The total deaths from diseases of the circulating organs amounted in the returns for 1841 to 4,279, in those for 1851 to 8,682, and, according to those for the past decade, to 18,858, or 10,628 males and 8,230 females, being in the proportion of 77.4 of the latter to 100 of the former. Of these 18,858 deaths, 5,003 were returned from the civic districts, or 1 in every 221 of their inhabitants, and 10,858 from the rural, or 1 in every 432; 898 were returned upon hospital forms and 2,099 on those for workhouses. 6,883 were returned from the province of Leinster, or 1 in every 212 of its inhabitants; 5,971 from Munster, or 1 in every 253; 4,311 from Ulster, or 1 in every 444; and 1,693 from Connaught, or 1 in every 539. In comparison with the total number of deaths registered from all causes, deaths from diseases of the circulating organs bore the proportion in 1841 of 1 in every 277; in 1851, 1 in every 157; and in 1861, of 1 in every 44.

Deaths from this class of diseases occurred at all ages, but the quinquennial age-period,

Deaths from this class of diseases occurred at all ages, but the quinquennial age-period, "sixty and under sixty-five" had many more registered in it than there were tabulated in any other similar period. A gradual annual increase occurred from the year 1852, when there were 1,294 deaths from this class of diseases, to the year 1860, when there were 2,862. In the report and tables of deaths given in the Census volume for 1841, diseases of the circulating organs were included with those of the respiratory system, and

the item "hæmorrhage" was placed under sporadic diseases of uncertain seat.

Diseases of the Respiratory Organs.

Cynanche.

No. 33. CYNANCHE—Laryngitis, Cynanche tonsillaris, Angina maligna, Diphtheritis, Cynanche parotidea, Œdema glottides; in Irish, Galar na Sgornaigh, disease of upper part of throat, Neascoid an Dibeachain, abscess in the windpipe. This general term of Cynanche is intended to include all diseases of the throat, pharynx, and larynx, returned on the Census forms, except croup. As, however, the deaths of 312 children under twelve months old have been registered under this heading, it is to be presumed that some cases of that disease (cynanche trachealis) have been included. The Census returns for 1841 afforded a total of 2,181 deaths under this heading; those for 1851, as many as 3,024, which is very approximate to the number returned on those for 1861—viz., 3,082, or 1,730 males and 1,352 females, being in the proportion of 78·1 of the latter to 100 of the former. Of these 3,082 deaths, 621, or 1 in every 1,784 of its inhabitants in 1861, were returned from the civic district, and 2,143, or 1 in every 2,189 from the rural; the hospital forms contained a record of 101 deaths from these diseases, and those for workhouses a return of 217. Deaths from Cynanche were registered at all ages; but the quinquennial periods at which most adults died were "fifteen and under twenty," "twenty and under twenty-five," and "sixty and under sixty-five." Deaths from these affections of the throat were in the ratio of 1 in every 266 of the total deaths from all causes.

Inflammation of the Lungs. No. 34. Inflammation of the Lungs—Pneumonia—Pleuritis, Pleura-pneumonia; in Irish, Ainteas an Sgamhain, excessive heat or inflammation of the lungs. The deaths attributed to this disease on the Census returns for 1861 amounted to 14,015, or 8,712 males and 5,303 females, being in the proportion of 60.9 of the latter to 100 of the former, and showing a decrease of 5,764 when compared with the returns for 1851; and of 13,669 when compared with those for 1841—a decrease probably to be attributed to a great many deaths being returned on the Census forms for 1861, and on those for 1851 as from bronchitis, which would have been formerly returned under the more general term of inflammation of the lungs. The greatest variation in the returns for the three decades is presented in the province of Munster, from which locality there were 13,725 deaths from this disease returned on the Census forms for 1841, and only 7,723 on those for 1851, and 5,297 on those for 1861.

Of the 14,015 deaths from inflammation of the lungs, 1,974 were returned from the civic districts, or 1 in every 561 of their inhabitants, and 8,264 from the rural, or 1 in every 568 (thus showing the proportion to be very similar in both districts); 791 (566 males and 225 females) were recorded on hospital forms, and 2,986 on those for workhouses. The only feature seemingly worthy of remark in the annual registry of deaths from this disease is the number entered for the year 1855, being greater than that for any of the four following years. Deaths from pneumonia were returned at all ages; the greatest number entered in any quinquennial age period being that "under five years," in which

were entered 2,285 deaths, of which number 1,129 were of infants under twelve months, in the proportion of 72.4 females to 100 males. After that age the following five-year periods had the largest numbers of deaths registered in them :-- "sixty and under sixty-five" deaths), "fifty and under fifty-five" (1,279), and "forty and under forty-five" (852). Inflamma:

Deaths from inflammation of the lungs were in the proportion of 1 in every 58 of the tion of the total deaths from all causes.

REPORT, ON Tables of

No. 35. Bronchitis—Peripneumonia notha; in Irish, Casochtach, contraction of the Bronchitis. chest, shortness of breath. In the Census returns for 1841 there were only 450 deaths attributed to this disease; in those for 1851 there were 9,737; and the returns for the past decade contain 17,723 entries of deaths from bronchitis,—8,941 males, and 8,782 females; being in the proportion of 98.2 females to 100 males. This increase in the number of deaths attributed to this disease is not, in all probability, caused by a greater spread of it throughout the country, but by the term having become more popular, and thereby having many deaths ascribed to it which would have heretofore been included with those from the preceding disease. The years 1855, 1858, and 1860, were those in which most deaths from bronchitis occurred; but assuming, which is probably the case, that the return for the last-mentioned year is the most accurate, and calculating the proportionate mortality from this disease to the population in 1861, we get a result of only 38.6 deaths in every 100,000 of the population, which goes far to show that although a great increase has occurred in the number of deaths ascribed to this disease in the returns for the three decades, still the distinction between it and inflammation of the substance of the lungs has not been sufficiently well defined, as the proportion of deaths from this disease in Scotland for the year 1859, was 113 in every 100,000 persons of the population, and in England as many as 132.\*

Of the 17,723 deaths from bronchitis, returned on the Census forms for 1861, 2,393 were returned from the civic districts, and 3,406 from the rural; the remainder or great majority of the deaths having been returned on medical evidence—viz., 1,069 from hospitals, and 10,855 from workhouses, where so many of the old and infirm are carried off by it. As many as 2,076 deaths of infants under twelve months old were attributed to this disease, and 1,691 were of children "one and under five years" old. Deaths from bronchitis are in the proportion of 1 in every 46 of the total deaths registered from all causes.

No. 36. Consumption—Phthisis; in Irish, Seirglighe, decay; Seirgean as, shrinking of Consumpone's self; Cnaoidh, wasting; Ethige, pulmonary consumption (West); Creacht an Sgamhain, tion. ulcer of lung. The subject of mortality from consumption was very fully entered into in the report on the tables of deaths in the Census of 1851, Part V., vol. I., page 447; and a minute inquiry was then made as to the effect of locality with regard to this disease, for which purpose a tabular statement was drawn up, in order to show the number of deaths which had occurred during the previous ten years in the seaport baronies of Ireland—this inquiry was instituted owing to the great difference of nearly 4 degrees in the temperature of the surrounding sea and that of the air over the land. From this investigation it was found that during the ten years ending in 1851, "while the proportion of deaths from this cause is to the general mortality 1 in 7:14 for the country at large, (exclusive of deaths in workhouses, hospitals, and public institutions,) the difference between the sea-board and the inland baronies is 1 in 6.82 in the former, and 1 in 7.70 in the latter."

As it is not likely that any change has since taken place in the proportionate mortality from consumption in these two divisions of Ireland, it has not been thought necessary to

make a similar investigation on the present occasion. The following results of the proportionate mortality from epidemic diseases and those of the chest appeared from the minute examination then made:—For the inland districts the proportionate mortality from the epidemic class of diseases was 1 in every 2.87, and for the sea-board line (which is, on an average, ten miles in breadth), 1 in every 2.65, the mean of both being 1 in 2.79; this calculation was irrespective of the deaths in institutions. Some very remarkable variations were observable in passing round the island, the proportion varying from 1 in 2.85 in the northern segment of the country to 1 in 2.02 in the south-western baronies, and from 1 in 3.18 in those of the south-east to 1 in 3.34 in the north-east baronies. Another remarkable result of the investigation was that mortality from diseases of the respiratory organs, and consumption in particular, was in the reverse ratio of that just quoted for the epidemic class of diseases; thus the proportion of deaths registered under the head of pulmonary consumption was in the baronies of the east coast as high as 1 in every 5.88 of the total deaths (this fact was ascribed to the trying east winds); in the northern baronies it was 1 in 7.87; in the southern, 1 in 8.22; and in those baronies lying along the western coast only 1 in 12.71.

Before dealing with the number of deaths registered under Consumption in the present tables of deaths, it may be well to observe that in accordance with the principle of regis-

Report on Tables of Deaths.

Consumption. tration adopted by the Census Commissioners in 1841 and 1851, those deaths returned upon the "A Forms" as from decline, decay, a wasting, &c., up to ten years of age, have been registered under the head of Marasmus.

The Census returns for 1841 afforded a total of 135,590 deaths from consumption; those for 1851, 153,098; and those for 1861, 130,739, or 62,118 males, and 68,621 females, being in the proportion of 90.5 of the former to 100 of the latter. Of these deaths, 29,543 were returned from the civic districts, being in the proportion of 1 in every 37 of the inhabitants thereof, in 1861, and 81,112 from the rural, or 1 in every 58; from the hospitals were returned 3,057 deaths from this disease, the males (as in 1851) being greatly in excess of females; and from workhouses, 17,027.

With regard to provinces, taking an average of the deaths from consumption returned for the three decades, we find the average decennial mortality in proportion to the population to be as follows:—Leinster, 1 in every 36; Munster, 1 in every 53; Ulster, 1 in every 53; and Connaught, 1 in every 69. For the total of Ireland during the same period the average mortality from consumption was 1 in 49.

The middle age-period of life embraced the great majority of the deaths tabulated under the head of consumption; all cases returned on the "A Forms" as having occurred from decline, decay, a wasting, &c., having been registered as Marasmus, when the persons were under ten years of age, and under "infirmity, debility, or old age" when they were over 50.

The deaths from consumption returned on the Census forms for 1841 bore the proportion of 1 in every 8.7 of the total deaths from all causes; those returned for 1851 were in the proportion of 1 in every 8.8; and those for 1861 were as 1 in every 6.3.

This disease was the most fatal recorded in the returns for the decade ending in 1861, and the second most fatal in 1841 and 1851; the greatest number of deaths in the former

being attributed to infirmity, debility, and old age; and in the latter to fever.

No. 37. Asthma—Emphysema (chronic); in Irish, Muchadh, a smothering; or Giorra anaile, shortness of breath. The deaths from asthma returned in 1841 were 10,594, upon which it is remarked in the report of that time, "as the symptoms of dyspnæa; difficulty of breathing; shortness of breath; cough with a smothering, &c., are also constant attendants on other lung affections besides asthma, (simple or spasmodic,) chronic emphysema, chronic bronchitis, &c., the registration under this head must speak for itself." The returns received for the decade ending in 1851 afforded 9,387 deaths from this disease, and those received in 1861 as many as 10,483, or 4,900 males and 5,583 females, being in the proportion of 87.8 of the former to 100 of the latter. Of these deaths, 1,826 were returned from the civic districts, and 6,781 from the rural; only 84 were returned on the hospital forms, and 1,792 on those for workhouses—viz., 687 males, and 1,105 females. Asthmatic affection has proved more fatal in Ulster, according to the returns for each of the three decades, than in any other of the provinces, possibly on account of the more sedentary life of its inhabitants.

Deaths of children under five years of age attributed to asthma on the "A Forms" have been registered under "Chest Affection unspecified." After which period, deaths at all ages are registered in the table, the five-year periods having most being "sixty and under sixty-five" and "seventy and under seventy-five." The deaths from asthma were in the

proportion of 1 in every 78 of the total deaths registered from all causes.

Water on the Chest.

Asthma.

No. 38. Water on the Chest—Hydrothorax; in Irish, Uisge cleibh, water on the chest. Deaths attributed to this cause amounted to 697, or 396 males and 301 females, being in the proportion of 76 of the latter to 100 of the former. Of these, 110 were returned from the civic and 171 from the rural districts; 52 were returned on hospital forms, and 364 on those for workhouses; the number of each of the sexes on the latter being identical. The number of deaths ascribed to water on the chest in the returns for 1841 was 158, and in those for 1851, 835. The decrease of deaths attributed to this disease between the decade ending in 1851 and that ending in 1861 may be said to have occurred altogether in the province of Ulster; the number returned for the former period being 335, and for the latter only 188.

Emphysema.

No. 39. EMPHYSEMA—Pneumothorax, air in the chest. There is no Irish term expressive of this affection. All the deaths (120) which have been tabulated under Emphysema in the accompanying tables, occurred in hospitals and workhouses, 66 having been returned from the former and 54 from the latter. The number of male and female deaths from this disease in workhouses was similar, but in hospitals the numbers were 49 males and 17 females. The great majority of the deaths from Emphysema were returned from the province of Leinster, as might have been anticipated from the greater number of hospitals being situated therein. The number of deaths attributed to this disease in the returns for 1841 was 18, and in those for 1851 it was 93.

Two deaths of infants (1 male and 1 female) were entered on the returns from the Rotundo Lying-in Hospital, Dublin city, as caused by "asthenia;" but this word was mistaken for "asthma" by the office clerk, and has been so printed in the tables. One death occurred in the year 1856, and the other in the year 1859.

No. 40. EMPYEMA—Purulent matter in the chest; in Irish, Neascoid cleibh, a boil or Report or abscess in the chest. Deaths from this disease, according to the returns furnished for the decade ending in 1841 amounted to 14; in 1851 to 19; and in 1861 to 46, or 30 males and 16 females. Fifteen of these were returned upon hospital forms, 29 upon those for Empyema. workhouses, and 2 from rural districts on "Form A."

No. 41. CHEST AFFECTION UNSPECIFIED—In Irish, Cliabh-ghalar, chest disease; and Bas Chest Affecdo ghreim, death by a stitch. There were not any deaths tabulated under this heading in tion Unspecific the tables for 1841, all chest affections having been assigned to some of the foregoing cified. diseases of the Respiratory Organs, or entered in the column for deaths from unspecified The returns for the decennial period ending in 1851 afforded a total of 9,452 deaths from this cause, whereas those for 1861 gave only 5,989, or 3,201 males and 2,788 females, being in the proportion of 87.1 of the latter to 100 of the former. It is worthy of remark that although upon the total for Ireland there appears a decrease of 3,463 deaths from this cause between the returns for 1851 and 1861, nevertheless an increase of 1,283 deaths from such diseases occurred in the province of Leinster, the decrease being spread over the other three provinces, but more particularly Munster and Connaught. It is also remarkable that the deaths from chest affections returned on the Census forms from the civic districts in 1861 exceeded the number returned on those for 1851; the decrease on the total before alluded to, occurring principally in the returns from the rural districts. The deaths of children under five years old greatly exceeded the deaths registered in any other quinquennial age-period, and the five-year period in which the next greatest number of deaths from this cause was tabulated was "sixty and under sixty-five." Deaths from chest affection unspecified bore the proportion, according to the Census returns for 1851, of 1 in every 144 of the total deaths from all causes, and according to those for 1861, of 1 in every 137.

The total number of deaths from diseases of the Respiratory Organs amounted, accord- Total Deaths ing to the Census returns for 1841, to 176,689; by those for 1851, to 205,424, and by those from Disfor 1861, to 182,894; the proportion of the sexes in 1841 was 97.8 males to 100 females; ease of the Respiratory in 1851 it was 94.6 females to 100 males; and in 1861, 97.1 males to 100 females. In Proportion to the deaths registered from all causes, deaths from this class of affections were, in 1841, 1 in every 6.7; in 1851, 1 in every 6.6; and in 1861, 1 in every 4.5.

### Diseases of the Digestive Organs.

No. 42. TEETHING—in Irish, Cur-fiacal, a sowing or planting of the teeth. The deaths Teething. from this cause returned on the Census forms for 1841 amounted to 3,303; on those for 1851 to 3,625; and on those for the past decade to 2,801, or 1,449 males and 1,352 females—being in the proportion of 93.3 of the latter to 100 of the former. The number of these deaths returned from the total civic district was much greater than that returned from the rural—the number from the former being 1,539, and from the latter 1,145. One death from "Teething" was recorded on an hospital form, and 116 such deaths were

entered on workhouse returns.

Of the 2,801 deaths, 1,250 were of infants under 12 months old, 1,178 were of children 1 year old, and the remainder (373) were of those between that age and 4 years old. Deaths of infants under 12 months old from teething were in the proportion of 1 death in every 86 of the total deaths at that age. It is probable that some deaths have been tabulated under this heading which were more properly attributable to other infantile diseases of the digestive organs, or to convulsions or cerebral affections.

No. 43. JAUNDICE—Icterus, Icterus infantum; in Irish, Galar buidhe, the yellow disease; Jaundice. Liath-bhuidhe, gray yellowness; Buidheachair chrochda, saffron yellowness. Deaths attributed to this disease in the Census returns for 1841 amounted to 1,306; in those for 1851 to 2.140; and in those for 1861 to 1,955, or 991 males and 964 females—being in the proportion of 97.3 of the latter to 100 of the former. Of these 1,955 deaths, 1,552 were returned on "Forms A"-291 from the civic districts and 1,261 from the rural; 102 were returned upon hospital forms, and 301 on those for workhouses. On pages 414 to 417 of Vol. I., Part V. of the Census Reports for 1851, will be found a detail of the great "yellow

pestilences" which affected this country in early times. No. 44. Worms-Vermes, Tania, Lumbrici, Ascarides; in Irish, Peiste, worms gene- Worms. rally; Peiste fada, long worms. To this cause were ascribed in the Census returns for 1841 as many as 3,895 deaths: 3,341 in those for 1851, and 2,972 in those for 1861, or 1,430 males and 1,542 females—being in the proportion of 92.7 of the former to 100 of the latter; the deaths of females exceeded the deaths of males also in the returns for 1841 and 1851. Dr. Farr, in his letter to the Registrar-General for England on the causes of

Repeat of Tables of Deaths. Weims death in 1861, says, "it is worthy of remark that girls suffer more than boys from worms," and suggests that "the female tissues, perhaps, afford the most fruitful nidus for parasites." Upon "Forms A" were returned 2,820 of these deaths—viz., 1,571 from the civic districts and 1,249 from the rural, thus showing a much larger proportionate mortality for the former than for the latter, which was also the case in 1851, and very properly ascribed to the food used in civic districts being more likely to generate parasitic animals than that generally used in the rural. Three deaths were returned upon the hospital forms, and 149 upon those for workhouses. Of the 2,972 deaths from worms, 1,850 were of children under 5 years old—being in the proportion of 1 in every 121 of the deaths at that age from all causes. A much larger number of deaths from this disease has been returned from Munster for each of the three decades than from any other of the provinces, for which fact it is difficult to assign any predisposing cause.

Colic.

No. 45. Colica—Colica, Colica pictonum; in Irish, Treaghaid, a piercing pain in the abdomen; Daigh imleacain, a dart through the navel; Currineacht, a twisting of the intestines, flatulency. Epidemics of colic in Ireland, extending from A.D. 981 to 1849, are chronologically tabulated at page 431 of Vol. I., Part V., of the Census Reports for 1851. To this abdominal disease were attributed in the Census returns for 1841 only 1,663 deaths; in those for 1851 as many as 7,562, and in those for the present occasion 5,046, or 3,204 males and 1,842 females—being in the proportion of 57.4 of the latter to 100 of the former—a disparity in the sexes which was exceeded in 1851, the proportion upon that occasion being 48.8 females to 100 males. The difference in the number of deaths returned for each of the three decades may probably be accounted for by cases of cholera (which this disease much resembles), having been returned as colic, and vice versa. Of these 5,046 deaths, 4,996 were returned on "Forms A"—viz., 453 from the entire civic district and 4,543 from the rural; 12 deaths from colic were returned on the hospital forms, and 38 on those for workhouses. The deaths of 1,007 infants under 12 months old were attributed to this disease, in the ratio of 70.4 females to 100 males—and in the proportion of 1 in every 107 of the deaths from all causes which were returned as having occurred at that age. "Under five years," and "sixty and under sixty-five," were the quinquennial age-periods at which colic was most fatal.

Gastric Fever. No. 46. Gastric Fever—Gastritis, Gastro-enterite, Gastritis erythematica; in Irish, Fiabhrus milighthcach, the pale fever. Deaths from this disease recorded on the Census returns for 1841 amounted to only 715, on those for 1851 to 1,340, and on those for the past decade to 1,323, or 642 males and 681 females. Of these 1,323 deaths, 773 were returned on the family schedules—viz., 517 from the civic districts, and 256 from the rural; the hospital forms afforded a return of 102, and those for workhouses 448. Nearly one-half of the deaths attributed to gastric fever in the present Census returns occurred in the province of Leinster.

The quinquennial age-period at which most deaths from this disease occurred, was "under 5 years old," after which age, deaths were registered at all the quinquennial

periods, with but little variation.

Dropsy.

No. 47. Dropsy—Ascites, Anasarca; in Irish, Uisge, water; Idropus, dropsy; Lionadh, filling. Deaths attributed to this disease on the Census returns for 1841, amounted to 23,332; on those for 1851 to 28,662, and on those for the past decade to 18,856, or 8,906 males and 9,950 females, being in the proportion of 89.5 of the former to 100 of the latter. As also resulted by the former Census inquiries, dropsy was the second most fatal of the diseases of the digestive organs. The decrease of 9,806 is not more than might have been anticipated as, independent of scarcity of people, many deaths attended by dropsical symptoms which occurred during the famine period, were induced by the want of proper food and other causes consequent thereon. As a proof thereof it may be remarked that the provinces of Munster and Connaught, which suffered most during the time referred to, present by far the greatest decrease in the deaths from this disease between the two decades. As stated in our Report on the Status of Disease, the partial alteration of the food of the people, from potatoes to diet of a cereal nature may have influenced this disease.

In the returns received for the ten years ending on the 30th March, 1851, the proportion of the sexes was 78.5 females to 100 males, a remarkable difference between the sexes in the returns for the two periods difficult to account for.

Of the 18,856 deaths returned on the Census forms for 1861, as many as 12,030 were returned on household schedules—viz., 2,783 from the civic districts, and 9,247 from the rural; 1,358 were recorded on the hospital returns, and 5,468 on those for workhouses.

Deaths from dropsy have been returned at all ages, the quinquennial age-period "under five years old," having 1,064 registered therein; in the next age-period, "five and under ten," there were 862, from which there was nothing remarkable in the five year age-periods, with the exception of that of "sixty and under sixty-five," which had many more

deaths tabulated in it than there were in any of the other periods—viz., 2,420. Deaths Report on from dropsy were in the proportion of 1 in every 43 of those registered from all causes.

On the night of taking the Census, 952 persons were suffering from dropsy.

No. 48. Disease of Intestines—Ileus, Intus-susceptio, Constipatio, Prolapsus ani, Disease of Humorrhois; in Irish, Sile na, bronn (ileus), spitting of the fæces; Currineacht, a twisting Intestines. of the bowels. In the Census Report for 1841, the deaths returned under this head amounted to but 42; in that for 1851 to 907; and from the returns upon which we now report, as many as 1,345, or 865 males and 480 females, being in the proportion of 55.5 of the latter to 100 of the former, were registered under the head of "Disease of Intes-The proportion of the sexes in the returns for 1851 was 64:3 females to 100 males. Of the deaths returned in 1861, 930 were recorded on Forms A.—196 from the civic districts, and 734 from the rural—106 were returned on hospital forms, and 309 on those for workhouses. The quinquennial age-period at which most deaths from disease of intestines occurred was "sixty and under sixty-five."

No. 49. Hernia. Hernia, H. Femoralis, H. inguinalis, H. Umbilicalis, &c.; in Irish, Hernia. Maidhm Seicne, a bursting of the covering of the belly. Deaths from hernia, according to the returns for 1841, amounted to 550, by those for 1851 to 441, and in the records for 1861 to 520, or 376 males and 144 females, being in the proportion of 38.3 of the latter to 100 of the former. Of these 520 deaths, 288 were returned on the household schedules -viz., 69 from the civic districts, and 219 from the rural; the deaths of 100 males and 61 females from hernia were returned on hospital forms, and of 44 males and 27 females on those for workhouses. The deaths of 50 children under five years old were attributed to hernia, of which number 31, or 28 males and 3 females, were of infants under twelve months old; it is presumed that these cases were congenital. Five instances were recorded of persons "five and under ten," 7 of persons between ten and fifteen; but the quinquennial age-period, "sixty and under sixty-five," afforded the largest number of

deaths from hernia.

No. 50. LIVER COMPLAINT—Hepatitis (acute and chronic); Cirrhosis, all affections of Liver Comthe liver; in Irish, Duinte na n-ae, closure of the liver; Laideachadh, excessive heat of plaint. the liver; Seirglighe, decaying liver. The deaths from this cause (which has been described in the early Dublin bills of mortality) amounted to 6,706, or 3,965 males and 2,741 females, being in the proportion of 69.1 of the latter to 100 of the former. Of these deaths, 1,311 were returned on "Forms A," received from the civic district, and 4,526 on those from the rural; the proportion to the inhabitants in 1861 being 1 in every 845 for the former, and 1 in every 1,037 for the latter; 202 deaths from this cause were recorded on hospital returns, and 667 on those from workhouses. The quinquennial ageperiods at which most deaths from this disease occurred were "fifty and under fifty-five,"

842 deaths, and "sixty and under sixty-five," 946 deaths.

The number of deaths attributed to "Liver Complaint" in the Census returns for 1841

was 7,038, and in those for 1851, but 5,963.

No. 51. Peritonitis—in Irish, Ainteas an sgamain, heat of the caul. The public in Peritonitis. general not being familiar with this term, it was not to be expected that many deaths would be found attributed to this cause on the family schedules; there were, however, 39-12 recorded on those from the civic districts and 27 on those from the rural—which is an increase of 29 over the number registered from a similar source in the Tables for 1851. One hundred deaths from Peritonitis were recorded on the hospital returns, and 114 on those from workhouses. The total number of deaths attributed to this disease in the Census returns for 1841 was 76, in those for 1851 it was 189, and in those for the decade

on which we now report, 253, or 134 males and 119 females.

No. 52. Inflammation of Bowels—Enteritis; in Irish, Ainteas na nimidhe, heat of the Inflamma-Deaths ascribed to inflammation of the bowels amounted to 13,258 for the tion of decennial period ending in 1841, but only numbered 2,938 during the following ten years, and 2,012 in the decade ending on the 7th April, 1861-1,277 males and 735 females, being in the proportion of 57.6 of the latter to 100 of the former. Of the number returned in 1841, only 97 were furnished from hospitals and sanitary institutions, the remainder (13,161) having been recorded on the household schedules. It is very probable that the fact of such comparatively small numbers being returned on the Census forms both in 1851 and 1861, is to be ascribed to the spread of pathological knowledge which enabled the persons filling the returns for those periods to recognise and describe diseases more accurately. Of the deaths returned in 1861, as many as 1,773 were entered on the household schedules—446 on those from the civic districts and 1,327 on those from the rural; 78 were entered upon hospital forms, and 161 on those for workhouses. deaths of infants under twelve months old amounted to 180, and of children "one and under five" years old, to 167. A gradual increase occurs in the numbers for each succeeding quinquennial age-period up to "twenty and under twenty-five," at which age

Report on Tables of Draths.

Marasmus.

106 deaths were recorded; the three quinquennial periods succeeding this had not so many deaths in them, but "forty and under forty-five" had 117, after which the deaths registered in each period were nearly equal.

No. 53. MARASMUS—Tabes mesenterica, Anemia, Atrophia, Tuberculosis mesenterica; in Irish, Cnai or Cnaoidh, wasting, with or without disease of the chest; Cuirrethe or Millte, "fairy-stricken." With regard to the deaths registered under the head of this disease, the principle observed in 1841 and 1851 has been adhered to; it is explained in the reports for those periods as follows:—" Marasmus was adopted as a generic term, under which to class all those various affections of infancy and early youth returned on the different forms as consumption (infantile), wasting, decay, decline, emaciation, general debility, and loss of strength. This arrangement became necessary from the multitude of deaths returned as consumption and decline under 1 year of age, and from 1 to 10. There can be little doubt that the great majority of cases of infantile deaths returned under the above popular headings were caused by scrofulous tubercular diseases, chiefly of the abdominal cavity, many of tabes mesenterica, and very many of chronic peritonitis, a disease of frequent and fatal occurrence in young children in this country. It is this affection which has given rise to the popular ideas respecting the 'changeling,' and in this country to the many superstitious notions entertained by the peasantry respecting their supposed 'fairy-stricken' children;—so that, year by year, up to the present day, we read accounts of deaths produced by cruel endeavours to cure children and young persons of such maladies, generally attempted by quacks and those termed 'fairy men' or 'fairy women.' Tumidity of the

The number of deaths tabulated under the head of marasmus in the tables of deaths for 1841 was 68,650, in those for 1851 it was 68,056, and 34,999 in those for 1861, or 16,987 males and 18,012 females—being in the proportion of 94.3 of the former to 100 of the latter; the deaths of females both in the returns for 1841 and in those for 1851 were also in excess of those of males. Of the deaths returned in 1861, so many as 10,073 were returned on "Forms A" received from the total civic district, or 1 in every 110 of its inhabitants at that date; 15,086 on those from the rural, or 1 in every 311; 166 were

abdomen, and general emaciation, form, no doubt, the prominent symptoms of the maladies here specified, although there may have been many cases of disease of the lungs included

returned on hospital forms, and 9,674 on those for workhouses.

in them, as well as all general tubercular diseases of early life."

Comparatively few deaths were tabulated as having been caused by marasmus over 10 years of age; the number of infants under 12 months old was 12,440; of children 1 year and under 5, the number was 14,641; and of those "five and under ten," 6,926. The deaths of 8 persons "eighty-five and under ninety," and of 7 aged "ninety and upwards," were attributed to this disease. Deaths from marasmus were in the proportion

of 1 in every 23 of the total deaths registered from all causes.

Disease of Stomach.

No. 54. DISEASE OF STOMACH—Gastritis, Gastrodynia, Gastralgia, Dyspepsia, Pyrosis; in Irish, Teinneas Croidhe or Muich-croide, smothering about the heart (pit of stomach); Galar an ghaile, sickness of stomach. Deaths attributed to disease of the stomach for the ten years ending on the 7th April, 1861, amounted to 3,616, or 2,084 males and 1,532 females—being in the proportion of 73.5 of the latter to 100 of the former. Of these deaths, 2,743 were returned on the family schedules—405 from the civic districts and 2,338 from the rural; 148 were recorded on hospital forms, and 725 on those for workhouses. Deaths from disease of the stomach were returned at all ages, but this disease, however, proved most fatal to persons over 40 years of age, and the quinquennial period in which most were recorded was "sixty and under sixty-five." The number of deaths ascribed to this cause in the returns for 1851 was 2,768. This affection did not form part of the nosological arrangement in the Census Report of 1841.

Total Deaths from Diseases of the Digestive Organs. The total number of deaths from diseases of the digestive organs during the decennial period ending in 1841 amounted to 123,828, in the proportion of 91 females to 100 males; during that ending in 1851 to 127,932, in the ratio of 88·3 females to 100 males; and during the past decade to 82,404, or 42,310 males and 40,094 females—being in the proportion of 94·8 of the latter to 100 of the former. The decrease in the number returned in 1861, when compared with the numbers returned for the two former decades, is chiefly consequent upon the decrease in the number of deaths tabulated under the heads of dropsy and marasmus, upon which we have just reported. Deaths from diseases of the digestive organs were, according to the Census returns received in 1841, in the proportion of 1 in every 9·6 of the total deaths registered from all causes; according to those received in 1851, of 1 in every 11; and by those received in 1861, of 1 in every 9·9.

Of the deaths returned for the recent decade, 19,666, or 1 in every 56 of the inhabitants

thereof in 1861, were returned on "Forms A" received from the civic districts, and 41,958, or 1 in every 112, on those received from the rural; 2,539 were returned on the hospital

forms, and 18,241 on those for workhouses.

According to ages, 15,891 were of infants under 12 months old, or 1 in every 6.8 of the Total Deaths total deaths at that age in Ireland during the 10 years; 36,051 were of children under 5 from Disyears old (including the foregoing), being in the proportion of 1 in every 6.2 of the ease of the total deaths of children under 5 years old. With regard to the remaining age-periods, Digestive Organs. 11.6 per cent. of the persons whose deaths were caused by this class of disease were "five and under ten;" 7 per cent. were "forty and under fifty;" 8.8 were "fifty and under sixty;" and 9.5 per cent. "sixty and under seventy."

According to provinces, the mean of the three decades gives the following result:-Leinster, 1 in every 49 of its population existing at the close of each of the three decades;

Munster, 1 in every 58; Ulster, 1 in every 72; and Connaught, 1 in every 78.

The number of persons in Ireland sick from diseases of the digestive organs on the night of taking the Census in 1851 was 4,511, or in the proportion of 1 in every 23 of the total sick from all causes; in 1861 the number was 3,767, or 1 in every 20.

## Diseases of the Urinary Organs.

No. 55. Stone—Calculus; in Irish, Cloch an leis, or Cloch an leasa, stone in the bladder; stone. To calculous affections Cloch fuail, the urine stone; Cloch an n-arann, the kidney stone. of the kidneys or bladder were attributed in the Census returns for 1841, 58 deaths; in those for 1851, 35; and in those for the decade on which we now report, 28, or 26 males and 2 females. Twelve of these deaths were returned on the family schedules—5 from the civic districts and 7 from the rural; 11 were returned upon hospital forms, and 5 upon those for workhouses. Thirteen of these deaths occurred in Leinster, 5 in Munster,

9 in Ulster, and 1 in Connaught.

No. 56. STRICTURE—Dysuria, Strictura; in Irish, Fostadh fuail, detention of the urine. Stricture. Deaths from this disease, which, according to the Census returns for 1841 amounted to only 28, increased in the following decade to 54; and still further increased during the. past decade to 197, or 193 males and 4 females. All the deaths from this cause returned in 1861 were recorded on hospital forms and on those for workhouses. It is, therefore, probable that, although the number is large, no deaths from any urinary disease except that affecting the urethra have been tabulated under the heading of stricture. was not any death from stricture returned for an earlier age than 15; the majority of deaths from this disease occurred between the ages of 50 and 75.

The province of Leinster afforded a return of 93 of these deaths; Munster, 51; Ulster,

39; and Connaught, 14.

No. 57. EXTRAVASATION OF URINE—The Census returns for 1841 exhibited a total Extravasaof 21 deaths from this cause; those for 1851, 19; and those for 1861, 37, or 35 males and tion of Urine. 2 females. Eighteen of these deaths occurred in workhouses, 11 in hospitals and sanitary institutions, and 8 were returned on the family schedules. Of the 37 deaths attributed to

extravasation, 14 were of persons aged between 60 and 70.

No. 58. DIABETES—Diabetes mellitus; in Irish, Dortadh fuail, immoderate spilling of Diabetes. the urine; Lonnchraos, a ravenous appetite. Allusion is made to this disease in Irish manuscripts, referring to times as early as the seventh century. Deaths attributed to this disease in the Census returns for 1841 amounted to 118, in those for 1851 to 158, and in those for 1861 to 354, or 267 males and 87 females. Of these 354 deaths, 232 were returned on the family schedules—viz., 45 from the civic districts and 187 from the rural; 51 deaths from diabetes were recorded on the hospital returns, and 71 on those for work-The majority of the deaths ascribed to this disease were of persons over 40 years of age; one death, however, will be found recorded in the tables of a male child 4 years old. That case was returned on a workhouse form; and a query having been sent as to the correctness of the entry, it was stated in reply that the death was so entered in the record book of the workhouse hospital. Eighty-two deaths from diabetes were returned on the Census forms received for the province of Leinster, 53 on those for Munster, 192 on those for Ulster, and 27 on those for Connaught.

No. 59. DISEASE OF BLADDER—Cystitis, Catarrhus Vesicæ, Morbus Prostaticus; in Irish, Disease of Galar an leasa, disease of bladder. In the Census returns for 1841 the deaths from disease Bladder. of bladder numbered 56, in those for 1851 they amounted to 161, and in those for 1861 to 217, or 190 males and 27 females. Twenty of these deaths were returned on A Forms received from civic districts, and 16 on those from rural; 83 were returned on hospital and 98 on workhouse forms. The quinquennial age-period at which most deaths occurred from this disease was "sixty and under sixty-five." Two deaths of female infants under 12 months

old from disease of bladder, were returned on the family schedules.

REPORT ON TABLES OF DRATHS.

Disease of Kidneys.

Ninety-eight, or nearly one-half of the deaths from this cause, occurred in the province

of Leinster, 48 in Munster, 50 in Ulster, and 21 in Connaught.

No. 60. DISEASE OF KIDNEYS—Nephritis, morbus Renum, Hæmaturia, Nephria (Bright's disease); in Irish, Galar na n-arann, disease of kidney; Cloch na n-arann, stone in the kidney. To the increased pathological knowledge of kidney disease may be ascribed the increase in the number of deaths attributed thereto. In the Census returns for 1841 there were but 7 deaths recorded as having occurred from disease of kidneys; in those for 1851, 246; and in those for 1861, as many as 709, or 527 males and 182 females—being in the proportion of 34.5 of the latter to 100 of the former. Of these 709 deaths, 116 were returned on the family schedules received from the civic districts, and 217 on those from the rural; 131 deaths from disease of kidneys were returned on hospital forms, and 245 on those for workhouses. From the province of Leinster, 394, or more than one-half of these deaths, were returned; 84 from Munster; 197 from Ulster; and 34 from Connaught. Deaths from kidney disease were returned at all ages, but the quinquennial period at which it proved most fatal was "sixty and under sixty-five."

Urinary Disease Unspecified.

No. 61. URINARY DISEASE, UNSPECIFIED—in Irish, Cosq fuail, checking of the urine. According to the Census returns received in 1841, the number of deaths from this cause was 2,849; according to those for 1851 it was 2,432, and by those for the past decade 2,197, or 1,988 males and 209 females. Of these 2,197 deaths, 2,103 were returned on the family schedules—239 from the civic districts and 1,864 from the rural; 44 on hospital forms, and 50 on those for workhouses. The province of Ulster afforded the largest number of deaths (780) from urinary disease unspecified; Leinster, 605; Munster, 437; and Connaught, 375. Some deaths of children under 5 years old have been registered under this disease, all of which were returned on family schedules. majority of deaths from this disease were of persons 50 years old and upwards, and the quinquennial age-period under which most deaths were tabulated is "seventy and under seventy-five."

Total Deaths from Diseases of the 🗜 UrinaryOrgans.

The total number of deaths attributed to diseases of the urinary organs in the Census returns for 1841 amounted to 3,137, or 1 in every 2,606 of the population at the time of taking the Census at that period; in the returns for 1851, the number was 3,105, or 1 in every 2,110 of the population at that time; and in 1861 it was 3,739, or 1 in every 1,551 of the inhabitants on the 7th April, 1861. Comparing the deaths from diseases of the urinary organs with the total deaths from all causes, they were, in 1841, 1 in every 379; in 1851, 1 in every 438; and in 1861, 1 in every 219. The proportion of the sexes was -in 1841, 14·1 females to 100 males; in 1851, 12·9 females to 100 males; and in 1861, 15.9 females to 100 males. Deaths from diseases of the urinary organs, according to provinces, when compared with the total deaths from all causes, were as follows: - Leinster, 1 in every 190; Munster, 1 in every 346; Ulster, 1 in every 184; and Connaught, 1 in The great majority of deaths from this class of diseases were those registered as having been caused by "Urinary Disease, Unspecified," most of which were returned under the popular term of "gravel."

## Diseases of the Generative Organs.

Childbed.

No. 62. Childbed—Effects of Abortion, Ruptured Uterus, Uterine hamorrhage, Puerpural Fever, &c.—Partus, Hysteritis, Metria, Metritis, Phlegmasia dolens; in Irish, Bas ag breith chlainne or Bas do naoidhandachd, death in childbed; Naoindachd or Ceas naoidhean, the debility of childbirth. Deaths consequent on parturition amounted according to the Census returns for 1841, to 13,903; by those for 1851, to 8,648; and according to those for 1861, to 8,795; of which 8,226 were recorded on the family schedules—viz., 1,343 from the civic districts, or 1 in every 825 of the inhabitants thereof in 1861, and 6,883 from the rural districts, or 1 in every 682 of their populations; 297 deaths of women in childbed were returned on hospital forms, and 272 on those for workhouses.

Summing the number of deaths from this cause at certain age-periods, according to the Census returns for 1851 and 1861, and taking the mean of the returns for the twenty years, we learn that of the total deaths in childbed during that time, 1.65 per cent. were of women aged under twenty years; 30.33 per cent. were of those "twenty and under thirty;" 46.91 were of those "thirty and under forty;" 19.15 were of those "forty and under fifty;" 1.43 were of women "fifty and under sixty;" 0.11 of women said to be aged sixty years and upwards; and that in 74 instances, or 0.42 per cent., the ages were not specified. The classification of ages adopted in the tables of the Census Report for 1841 not being precisely the same as that adopted in 1851 and 1861, prevents us making a comparison therewith as to the ages of the females who died in childbed. Assuming the estimated number of births given in the table printed upon page 16, as having occurred in Ireland during the decade, to be correct, we find the death of one mother in childbed to every 226 births. As the returns of deaths are doubtless defective from causes already explained, this proportion is considerably under the mark. Epidemics of puerperal fever which occurred in Ireland from the year 1767 to 1845, both inclusive, Childbed. are recorded in the Report on tables of deaths, for the Census of 1851, on page 458, Vol. I.

DEATHS.

Part V. A return of 642 women in childbed was received for the night on which the Census was taken in 1861, being 1 in each 4,613 of the female population.

No. 63. Prolapsus Uteri; in Irish, Tuitim an mhacloigh, a falling of the womb, Prolapsus literally, falling of "the place of the child." The number of deaths attributed to this disease, furnished on the Census returns for 1841, was 4; on those for 1851, 11; and on those for the past decade, 13. Only 2 of these 13 deaths were returned on the family schedules. One was returned upon an hospital form, and 10 were entered upon the forms for workhouses. The ages of the women whose deaths were attributed to this cause

ranged from 35 to 80 years.

No. 64. OVARIAN DISEASE—Hydrops ovarii. In the report upon the tables of deaths Ovarian for 1841, we find that 6 deaths from this cause were recorded; according to the returns Disease. for 1851, 19 fatal cases had occurred during the previous ten years; and by those received for 1861, the deaths from ovarian disease were as many as 49, 19 of which were returned from Leinster; 13 each from Munster and Ulster; and 4 from Connaught. The deaths of 3 females aged "fifteen and under twenty," were ascribed to ovarian disease, and of a like number of women aged. "seventy and under seventy-five;" there were 11 deaths registered at "twenty-five and under thirty," which was the largest number returned for any quinquennial age-period. Of the 49 deaths, 9 were returned on the family schedules, 21 on hearital forms and 10 on these for weakly ages. 21 on hospital forms, and 19 on those for workhouses.

No. 65. CANCER UTERI. The deaths attributed to this disease in the Census returns for Cancer 1841 numbered 49; in those for 1851 they amounted to 170; and in those for the period Uteri. on which we now report, to as many as 313, of which number 90 were returned on the A Forms, or "family schedules"—viz., 41 from the civic districts, and 49 from the rural; 61 deaths from cancer of the womb were returned upon hospital forms, and 162 occurred in workhouses. Nearly one-half (135) of these deaths occurred in Leinster; 61 in Munster; 93 in Ulster; and 24 in Connaught. One female aged under twenty years, was returned as having died from this disease during the decade; and the death of another as old as "eighty-five and under ninety," was also ascribed to this cause; the majority of the deaths, however, were of females aged between forty and sixty-five.

No. 66. DISEASE OF GENITAL ORGANS (Male and Female)—Paremia, Menorrhagia, Disease Amenorrhæa, Chlorosis, Leucorrhæa, Sarcocele, Spermatorrhæa; in Irish, Cosg na fola miosa, of Genital checking of the monthly flow; Uisgeamhlacht na nuirgeadh, wateriness of scrotum Organs. (Hydrocele); Dortadh sil, spilling of seed. The number of deaths attributed to these causes for the decennial period ending in 1851 was 98, and for that ending in 1861, 114, or 38 males and 76 females; of which number 27 were returned on the family schedules; 42, or 17 males and 25 females, on hospital forms; and 45, or 5 males and 40 females, on those for workhouses. To disease of genital organs undefined, but probably congenital malformations, were attributed the deaths of 11 infants under 12 months old, and of 6 children between that age and 5 years; after this age, the quinquennial period in which the largest number of deaths have been registered is "fifteen and under twenty," in which have been tabulated 14—all females.

The total deaths attributed to diseases of the generative organs in the Census returns Total Deaths for 1841 amounted to 13,962, or 1 in every 586 of the population existing at the termina- from Distion of that decade; in those for 1851 to 8,946, or 1 in every 732 of the people on the eases of the 20th March 1851, and in the returns upon which we now report the deaths from these Generative 30th March, 1851; and in the returns upon which we now report the deaths from these Organi. diseases amounted to 9,284, or 1 in every 625 of the inhabitants in 1861. Deaths from diseases of the generative organs recorded in the Census returns for 1841 were 1 in every 85 of the total deaths registered from all causes; in those for 1851 they were 1 in every 152; and in those for 1861 they were 1 in every 88. In proportion to the deaths of females from all causes in each of the three periods, deaths from this class of diseases were—in 1841, 1 in every 40.6; in 1851, 1 in every 70.5; and in 1861, 1 in every 43.2.

## Diseases of the Locomotive Organs.

No. 67. RHEUMATISM—Rheumatismus, Arthritis, Lumbago, Sciatica, Gout; in Irish, Rheuma-Scoilteach, a splitting or disease of the bones; Tinneas cnamh, pains of the bones. The tism. number of deaths attributed to this cause in the Census returns for 1841 was 3,511; and in

Report on Tables of Deaths.

Rheumatism. the report thereon it was remarked that "acute and chronic arthritis (many of which were probably cases of venereal), and inflammation of the joints and periosteum; what is generally termed rheumatic fever, and all fatal diseases attended with [gouty or] rheumatic pains of every description, have been in all probability the grounds on which those deaths were recorded." This remark applies also to the returns for 1851 and 1861. At the former period there were 6,064 deaths returned from rheumatism, and for the latter 7,506, or 3,779 males and 3,727 females—being in the proportion of 98 6 females to 100 males—very different from the returns for the decade ending in 1851, in which the proportion was 78.4 females to 100 males.

From the northern province of Ulster the greatest number of these deaths (2,546) was returned; 1,919 were recorded on the forms for Leinster, 1,963 on those for Munster, and 1,078 on those received from Connaught. As many as 6,544 of these deaths were returned on the family schedules—viz., 774 from the civic districts and 5,770 from the rural, thus showing that the great bulk of the mortality from rheumatic affections occurred in the latter, a result which might have been expected from the greater liability of their inhabitants to exposure to the weather—generally the remote cause of death from this disease. From the hospital returns 186 deaths from rheumatism were registered, and 776 from those for workhouses. Deaths returned upon the family schedules under 5 years of age as from rheumatism, have been tabulated, as heretofore, under the head of "Disease of Bones and Joints." One death, however, of a male child 4 years old, ascribed to rheumatism on a form received from a general hospital, has been so recorded in the tables. After 5 years, deaths were recorded at all ages, but "sixty and under sixty-five" was the quinquennial period at which most deaths from this cause were returned. The number of persons suffering from rheumatism on the night of taking the Census in 1861 was 4,103, or 1 in every 19 of the total sick.

Diseases of Bones and Joints. No. 68. DISEASE OF BONES AND JOINTS—Necrosis, Caries, Periostitis, Synovitis; in Irish, Teannadh, tension or non-expansion of the body (rickets). The number of deaths returned as having been caused by diseases of the bones and joints during the decade ending in 1841 was 1,903; for that ending in 1851, the number was 1,836; and for that ending in 1861, 1,672, or 1,006 males and 666 females—being in the proportion of 66.2 of the latter to 100 of the former. Of these 1,672 deaths, 172 were returned on Forms A received from the civic districts, and 944 on those from the rural; from the hospital returns were extracted 189 deaths from diseases of bones and joints, and 367 such deaths occurred in workhouses. Deaths from these diseases were returned at all ages, the number registered under 5 years old being in excess of that returned for any other quinquennial age-period.

Hip Disease.

No. 69. HIP DISEASE—Morbus coxæ, Morbus coxæ senilis, Coxalagia; in Irish, Galar na leise, disease of the hip. In the Census returns for 1841 the number of deaths stated to have occurred from hip disease amounted to 89, in those for 1851 to 390, and in those for 1861 to 661, or 417 males and 244 females. Of these 661 deaths, 145 were returned on the family schedules received from the civic districts and 197 on those from the rural; a return of 61 deaths from hip disease was made on the hospital forms, and of 258 on those for workhouses. Deaths from this cause were registered at all ages, but the age-period, 10 to 25 years, showed a proportionately large number, a remark which also applies to the returns for 1841 and 1851. Nearly one-half (315) of the deaths from this disease were returned from Leinster, 160 from Munster, 118 from Ulster, and 68 from Connaught.

Spine Disease. No. 70. Spine Disease—Morbus vertebræ; in Irish, Galar droma, disease of the spine. In the Census returns for 1841, 325 deaths were attributed to this disease; in those for 1851 there were 800; and in those for 1861, 1,734, or 1,045 males and 689 females, being in the proportion of 65.9 of the latter to 100 of the former. This increase in deaths attributed to disease of the spine was not confined to any particular locality, the deaths having largely increased in each of the four provinces; nor was it limited to any particular district, the returns received from both the rural and the civic districts showing each a proportionate increase, and the deaths in hospitals and workhouses being likewise more numerous than those returned in 1851. Of the 1,734 deaths returned on the Census forms for 1861, 368 were returned upon Forms A received from the civic district, and 603 on those received from the rural; 190 deaths from spine disease occurred in hospitals and 753 in workhouses. Deaths from this disease were returned at all ages; 44, (21 males and 23 females), were of infants under twelve months, and 187 were of children under five years old. The quinquennial age-period at which most deaths from disease of the spine occurred was "fifteen and under twenty."

Fracture.

No. 71. FRACTURE—Fractura; in Irish, Briseadh, fracture, sprain. Deaths from fracture, according to the Census returns for 1841, were, during the ten years previous to that date, 540; during the decennial period ending in 1851 they were 938, and during the decade ending in 1861 they amounted to 743, or 504 males and 239 females. Of these 743 deaths, 276 were returned on the "Family Schedules," viz., 58 from the civic districts

and 218 from the rural; 342 deaths from fracture occurred in hospitals, and 125 were registered from workhouse returns. The quinquennial age-period at which most deaths from fracture occurred was "sixty and under sixty-five," at which age 99 were returned, and 72 persons whose deaths were attributed to this cause were "seventy and under Fracture. seventy-five." 265 deaths from fracture were returned from Leinster, 192 from Munster,

REPORT ON DEATHS.

188 from Ulster, and 98 from Connaught.

No. 72. DISLOCATION—Luxatio; in Irish, Cur as ionad, dislocation, sprain. Deaths Dislocation. attributed to this cause during the decade ending in 1841 numbered, according to the Census returns, only 18; those during that ending in 1851 amounted to 68; and for that ending in 1861, to 114, or 70 males, and 44 females. Of these 114 deaths, 11 were returned on Forms A received from the civic districts and 78 on those from the rural; 13 occurred in hospitals, and 12 in workhouses; but what was the precise nature of the accident was not stated. The deaths of 3 infants under twelve months old, of 4 children between that age and five years, of 18 persons between the ages of fifteen and twenty, and of 12 (all

males) between forty and forty-five, were attributed on the returns to dislocation.

No. 73. AMPUTATION—In Irish, Timdibhe baill, removal of a limb. According to the Amputation. Census returns for 1861, 67 deaths followed amputation (55 males and 12 females); 11 of which occurred at the homes of the deceased situated in the civic districts, and 33 in the rural; 9 occurred in hospital, and 14 in workhouses. The youngest age at which death was attributed to this cause was "five and under ten," at which age-period the death of one male was registered; and the oldest, that of "seventy-five and under eighty," in • which period the deaths of two males were tabulated; the remaining deaths were pretty evenly distributed over the intermediate age-periods. The number of deaths consequent on amputation during the decennial period ending in 1851 was 59; in the Report on Tables of Deaths for 1841 "amputation" was not specified in the nosological arrangement.

The total deaths from diseases of the locomotive organs returned on the Census forms Total Deaths for 1851 were 10,155, in the proportion of 67.5 females to 100 males, and on those for the from Dispast decade 12,497, in the ratio of 81.7 females to 100 males. The number of deaths attributed in the returns for 1841 to diseases of the locomotive organs (with the exception of Organs. "amputation," which could cause but a very slight difference), was 6,386; being in the proportion of 1 death in every 186 of the total deaths registered from all causes. The proportion in 1851 was 1 in every 134, and in 1861, 1 in every 66. According to provinces the number of deaths from diseases of the locomotive organs was, in Leinster, 3,722, or 1 in every 392 of its inhabitants, in 1861; in Munster, 3,272, or 1 in every 463; in Ulster, 3,816, or 1 in every 502; and in Connaught, 1,687, or 1 in every 541.

### Diseases of the Tegumentary System.

No. 74. Ulceration.—Ulceratio, Phagedena, Noma, Lupus, Cancrum oris, Noli me tangere, Ulceration. Morula, Tinea capitis; in Irish, Lot or Cneadh, a sore or wound; Ruaghtagh, cancrum oris; Ceann carrach, scald head; Carradh, the scald. Deaths from ulceration, according to the Census returns for the decade ending in 1841, amounted to 3,399; according to those for 1851, to 3,634; and by those for the past decade, to 3,138, or 1,903 males and 1.235 females, being in the proportion of 64.8 of the latter to 100 of the former. Of these 3.138 deaths, 234 were returned upon "Family Schedules" received from the civic districts and 1,840 on those from the rural; 155 were registered from hospital returns, and 909 from those of workhouses. The early years of the decade proved the most fatul from this disease. Upon each of the three last Census inquiries the deaths from this disease in Munster were greatly in excess of those in any of the other provinces. Deaths from ulceration have been registered at all ages.

No. 75. PURPURA AND Scurvy—Purpura hamorrhagica, Scorbutus; in Irish, Galar Purpura breac, the speckled disease. A historical record of scurvy is given at page 249 of Vol. and Scurvy. I., Part V., of the Census Reports for 1851. The number of deaths attributed to it in the Census returns for 1861 amounted to 375, or 230 males and 145 females, being in the proportion of 63 of the latter to 100 of the former. Of these deaths, 35 were returned on "Family Schedules" received from the civic districts, and 184 on those from the rural; from the hospital returns 46 deaths from this cause were registered, and 110 occurred in workhouses. The years 1853, 1858, and 1859, afforded most deaths from this cause the sequel to the prevalence of land scurvy which marked the closing years of the famine-The deaths of 48 infants under twelve months old, and of 72 children between that age and five years old, were attributed to purpura or scurvy. After that age, the quinquennial period having most registered in it is "five and under ten."

REPORT ON Tables of DRATHS.

Fistula.

The number of deaths ascribed to purpura and scurvy in the Census returns for 1851

was 167, and in those for 1841 only 39.

No. 76. FISTULA—Fistula in ano, Fistula in perineo, Vesico-vaginal fistula; in Irish, Feadan, a tube or small stream; or Linighan, a running stream. The number of deaths attributed to this disease in the Census returns for 1841 was 64; in those for 1851 it was 71; and in those for the past decade 99, or 75 males and 24 females. Of these 99 deaths, 57 were returned on the "Family Schedules"—viz., 13 from the civic district and 44 from the rural; 16 deaths from fistula occurred in hospitals, and 26 in workhouses. The quinquennial age-period at which most of these deaths occurred was "forty and under forty-five."

Anthrax.

No. 77. Anthrax—Carbunculus; in Irish, Meall, a globular lump; Adhbhar, an abscess containing matter; Fiolun, a phlegmon (old term). Deaths attributed to anthrax in the Census returns for 1841 amounted to only 26; in those for 1851 they reached 90; and in those for 1861 they were as many as 230, or 153 males and 77 females; 124 of these deaths were returned on the Family Schedules-viz., 28 from the civic districts and 96 from the rural; 45 were returned upon hospital forms, and 61 on those for workhouses. The quinquennial age-period in which most deaths from anthrax were registered was "sixty and under sixty-five," a result similar to that shown for the previous decade. Although there has been a large increase in the deaths from anthrax during the decennial period ending in 1861, when compared with that preceding it, the number returned for each of the years thereof does not lead to the belief that it partook of the nature of an epidemic during any portion of the period.

Lepra and other Skin Diseases.

No. 78. LEPRA AND OTHER SKIN DISEASES—Lepriasis, Elephantiasis, Psoriasis; in Irish, Luibhre, leprosy. A report upon the true leprosy as it existed in Ireland from A.D. 432, when St. Patrick maintained a leper, up to the year 1775, when one leper was found in the Waterford hospital, is given at page 419 of Vol. I., Part V., of the Census publications for 1851. Deaths from cutaneous diseases recorded in the Census returns for 1841 amounted to only 17, in those for 1851 the number was 450, and in those for the recent decade 416, or 228 males and 188 females. Of these 416 deaths, 224 were returned on the household forms—viz., 13 from the civic districts and as many as 211 from the rural; 14 were returned upon hospital forms and 178 upon those for workhouses. The greatest absolute number of these deaths, and by much the greatest proportionate number as regards its population, was returned from the province of Connaught.

Total Deaths from Diseases of the Tegumentary System.

The total number of deaths attributed to diseases of the tegumentary system in the Census returns for 1841 was 3,545, in the proportion of 57 females to 100 males, and in the ratio of 1 in every 335 of the total deaths registered from all causes; in those for 1851 it was 4,412, in the proportion of 59 females to 100 males, or 1 in every 308 of the total; and in the returns for the past decade, 4,258, in the proportion of 64.5 females to 100 males, and of 1 in every 193 of the total deaths from all causes. In the returns for 1861 the quinquennial age-period, "under five years," afforded the greatest number of deaths from these causes—viz., 803, of which deaths, 361 or 183 males and 178 females, were of infants under 12 months old—of these latter, the deaths of 80 males and of a like number of females were attributed to lepra and other skin diseases; after that age, the 5. year age-period affording the largest number of deaths was "sixty and under sixty-five." With regard to provinces, according to the Census returns received in 1861, 1,054 deaths were caused by diseases of the tegumentary system in Leinster, being equal to 1 in every 1,383 of its population at that time; 1,703 in Munster, or 1 in every 889; 745 in Ulster, or 1 in every 2,569; and 756 in Connaught, or 1 in every 1,208.

### Diseases of Uncertain Seat.

Inflammation.

No. 79. Inflammation—Phlegmon; in Irish, Deargadh, redness; Lasadh, inflammation; At, a swelling of any kind. We copy the following remarks upon inflammation from Sir William Wilde's report upon the tables of deaths in 1841, as being equally applicable to the returns upon which it is now our province to report:—" No term is in more general use. and none more vague and indefinite, in a statistical point of view, than this, which, from its being either the proximate or remote cause of death—the original or subsequent affection in so many of the ills to which man is subject from the cradle to the grave, and also the process by which healing or repair takes place in living bodies, might be applied to at least one-half of the diseases specified in the nosology. This definition must, therefore, in our present state of knowledge (and it is the case with nearly all other tables of death

yet recorded) stand as a general term in like manner with marasmus or infantile convulsions, for all those deaths in which inflammation either of external parts or of some of the internal organs or viscera, not specified under separate heads (as pneumonia or peritonitis) took place; but different from marasmus or convulsions, it was, in all probability, the cause Inflammaof death, they being only the symptoms of disease."

REPORT OF DEATHS.

In the Census returns for 1841 the deaths registered under the heading of "inflammation unspecified" numbered 15,263; between that period and the time of taking the Census in 1851 the amount of deaths from this cause decreased to 9,967; but slightly increased during the ten years between 1851 and the time of the enumeration of the people in 1861, when the number recorded on the returns was 10,108, or 5,750 males and 4,358 females—being in the proportion of 75.8 of the latter to 100 of the former. Of these, 2,994 were returned on A Forms received from the civic districts, and 6,931 on those derived from the rural; 66 deaths were ascribed to inflammation upon the hospital forms, and 117 upon those for workhouses.

It is very remarkable that of the 10,108 deaths ascribed to inflammation, 7,388 were returned from Ulster-it is, therefore, probable that diseases described by other names in Leinster, Munster, and Connaught, are popularly termed "inflammation" in that province; and all of these 7,388 deaths were returned on the household schedules with the exception of 37, of which, 14 were recorded on hospital forms and 23 on those for workhouses. number of deaths ascribed to this disease in the Census returns for 1841 and 1851 respectively, was also much greater for Ulster than for any of the other provinces—a remark which has been made on page 22 with regard to pemphigus (which is also a disease of an inflammatory nature), being almost peculiar to that province. The number of deaths of children under 5 years old (4,032) registered as having resulted from inflammation very much exceeded the deaths from that disease returned for any other quinquennial age-period. Of these deaths, 2,204 were of infants under 12 months old, the sexes being 1,312 males and 892 females. Deaths from inflammation were in the proportion of 1 in every 81 of the total deaths registered from all causes.

No. 80. Phlebitis—Phlegmasia dolens. In the death tables for 1841 were tabulated 9 Phlebitis. deaths from this disease, in those for 1851 there were 45, and in those for 1861 there are 194, or 105 males and 89 females; of these 194 deaths, 154 were returned on the family schedules, 12 on hospital forms, and 28 on those for workhouses. Deaths from phlebitis were in the proportion of 1 in every 4,226 of the total deaths registered from all causes, and the quinquennial age-period at which most of them occurred was "sixty and under

sixty-five.

No. 81. Mortification—Sphacelus Gangræna senilis; in Irish, Morgadh, mortification, Mortificaor Aingceas, excessive inflammation. The number of deaths attributed to mortification tion. in the Census returns for 1841 was 5,810; in those for 1851 it was 3,901; and in those for 1861 but 2,366, or 1,333 males and 1,033 females, being in the proportion of 77.5 of the latter to 100 of the former. As we proceed northwards, the number of deaths occurring from external diseases of an inflammatory nature increases, and thus we find that, taking together the deaths returned to us as having been caused by inflammation, pemphigus, and mortification, 78.8 per cent. of them were returned from the province of The majority of these cases were probably attended with eruptions of the skin of either an acute or chronic nature, &c. The deaths in Ulster from inflammation, pemphigus, and mortification, were in the proportion of 1 in every 17 of the total deaths in that The quinquennial age-period at which most deaths from mortification occurred was "under five years," for which 875 were returned, of which number 501, or 282 males, and 219 females, were of infants under twelve months old.

No. 82. Malignant Fungus—Fungus hæmatodes, Melanosis; in Irish, Aillsi, the foul Malignant flesh disease (the same as Cancer). Deaths from this affection returned on the Census forms for 1841 amounted to 200; on those for 1851 to 307; and on those for 1861 to 280, or 129 males and 151 females. Of these 280 deaths, 177 were returned on the "Family Schedules"—viz., 47 from the civic districts and 130 from the rural; a record of 21 deaths from malignant fungus was given on the hospital returns, and of 82 on those for workhouses; 202 of these deaths were of persons under 20 years old, 74 were of persons over that age, and in 4 cases the ages were unspecified. It is highly probable that the excess in the numbers under 20 years is caused by the fact that deaths of persons under that age ascribed to cancer on the "Family Schedules," have been tabulated under the head of Malignant Fungus, although, doubtless, had we the means of more minutely investigating these cases, we would find scrofula to be the form of disease to which many of them would be more properly attributable.

No. 83. SCROFULA—Struma; in Irish, Easbaidh braghad, deficiency in the neck; Fiolun, Scrofula. the treacherous disease; Cneadh Cnaitheach, the wasting ulcer; Cuit-braghad, cats in the neck. The Census returns for 1841 contained a record of 3,149 deaths from

REPORT ON TABLES OF DEATHS.

Scrofula.

scrofulous affections; those for 1851 of 6,774; and those for 1861 of 6,377, or 3,647 males and 2,730 females, being in the proportion of 74.9 of the latter to 100 of the former. Of these 6,377 deaths, 304 were returned on Family Schedules received from the civie districts, and 2,330 on those from the rural; 336 deaths were attributed to this disease on the hospital returns, and 3,407 on those from workhouses. Thus it will be seen that of the deaths immediately attributed to scrofula, nearly all occurred among the inhabitants of rural districts. The quinquennial age-period at which most deaths were returned as having been caused by scrofula, was "15 and under 20;" the respective age-periods immediately preceding and following were, however, nearly equal to it in mortality.

The number of deaths returned under the head of Scrofula (as was also stated in the reports for 1841 and 1851) bear but a very inadequate proportion to the number of

deaths of which it was the remote cause.

Gout.

No. 84. Gout—Podagra; in Irish, Guta, gout; or Galar na n-alt, disease of the ankle The number of deaths attributed to gout in the Census returns for 1841 was 360; in those for 1851, it was 272; and in those for 1861, 228, or 183 males and 45 females. Of these 228 deaths, 91 were returned on "Family Schedules" received from the civic districts, and 127 on those from the rural; only 1 death from gout was returned as having occurred in hospital, and the deaths of 9 persons (5 males and 4 females) were ascribed to this cause on the workhouse forms. The earliest age at which death from gout was recorded, was "15 and under 20" (1 female); the deaths of 3 males from this disease were returned for the next quinquennial age-period, but the five-year period furnishing the greatest number was "60 and under 65." This disease was fatal to 91 persons in Leinster,

Cancer.

to 70 in Munster, to 46 in Ulster, and to 21 in Connaught.
No. 85. Cancer—Carcinoma; Scirrhus; in Irish, Aillsi, the foul flesh disease. of death ascribed to cancer under 20 years of age, except those recorded on hospital forms, have been entered under the head of Malignant Fungus. The number of deaths attributed to this disease in the Census returns for 1841, was 3,890; in those for 1851 it was 4,091; and in those for 1861 the number amounted to 5,462, or 2,508 males and 2,954 females, the females predominating in the ratio of 117.8 to 100 males. Of these 5,462 deaths, 842 occurred at the homes of the deceased in the civic districts, and 3,429 in the rural; 215 took place in hospitals, and 976 in workhouses. Death from cancerous or malignant diseases were returned at all ages, but the quinquennial age-period at which true cancer proved most fatal was "60 and under 65." In the returns for the three decades there were many more deaths ascribed to cancer in Leinster and Ulster than there were in

Munster or Connaught.

Tumour.

No. 86. Tumour; in Irish, Cnap, a lump of any description; Faithne, a wart; Neascoid Leanna fuair, a cold, or uninflamed lump. The number of deaths attributed to tumour in the returns for 1841 was only 78; in those for 1851 it was 366; and in those for the recent decade as many as 1,402 were recorded—763 males and 639 females, being in the proportion of 83.8 of the latter to 100 of the former. Of these 1,402 deaths, 1,222 were returned on the "Family Schedules;" 79 on hospital forms, and 101 on those for work-Under the head of Tumour may have been entered many deaths which should probably have been more properly returned as Abscess on the forms for 1851, as a large

decrease appears between the two periods in the deaths from that disease.

Abscess.

No. 87. Abscess—Abscessus; in Irish, Meall, a lump; Neascoid, an abscess, a boil. Deaths attributed to this cause during the decade ending in 1841 were 606; in that ending in 1851, 2,102; and in that ending in 1861, 1,400, or 785 males and 615 females, being in the proportion of 78.3 of the latter to 100 of the former. Of these 1,400 deaths, 605 were returned on the "Family Schedules," 186 on hospital forms, and 609 on those for work-The larger number of deaths attributed to abscess on the hospital and workhouse returns than to tumour, strengthens the supposition that a great many cases returned as tumour on the Household Schedules would have been more properly described as abscess. The number of deaths of children under 5 years old tabulated under the head of Tumour and Abscess respectively, exceeds that entered in any other quinquennial age-period.

Infirmity, Debility, and Old Age.

No. 88. INFIRMITY, DEBILITY, AND OLD AGE—in Irish, Easlainte, non-health; Seandachd, senility; Crine, decayance; Fuirfeacht, dryness. As was stated in Sir William Wilde's report upon the tables of deaths in 1841, "there is, perhaps, properly speaking, no precise time at which man in any country or under any circumstances, can be said to die of pure old age uninfluenced by disease; or if such a period does exist, it has not yet been defined; or if it ever shall be defined, the exceptions to meet the circumstances of individual cases must . Few of the present generation die of old age, in the fullest far exceed the rule. meaning of that term; and, says Dr. Farr, 'there is reason to believe that many of the diseases of the aged are not detected, and that the terms "old age" and "natural decay" are often incorrectly assigned as the cause of death." Deaths from decay, decline, debility, "a wasting," and infirmity, were returned at every age; but, as a general rule, all such cases,

REPORT OF

TABLES OF DRATHS.

except those afforded on medical authority, were distributed in the tables as follows: those of persons under 10 years of age to marasmus; those 10 and under 50 to consump. tion; while those of persons 50 and upwards were entered under the heading with which we are at present dealing. The number of deaths entered under "infirmity, debility, and old Infirmity, age" in the Census tables for 1841 amounted to 206,511; in those for 1851 to 133,923; and Debility upon the present occasion to 102,993, or 45,588 males and 57,405 females, the number of and Old Age. females exceeding the males in the ratio of 125.9 to 100. Of these 102,993 deaths, 13,629 were returned on the family schedules for the total civic district, or 1 in every 81 of the inhabitants thereof in 1861, and 73,830 on those for the rural, or 1 in every 64 of its population; 1,221 deaths ascribed to these causes occurred in hospitals, and as many as 14,313 in workhouses. The quinquennial age-period at which most of these deaths occurred was "seventy and under seventy-five." With regard to provinces, 33,792, or 1 in every 43 of its inhabitants in 1861, were returned from Leinster; 23,899 from Munster, or 1 in every 63 of its population; 33,471 from Ulster, or 1 in every 57; and 11,831 from Connaught, or 1 in every 77. In accounting for the decrease between the number of deaths from these causes afforded by the Census forms for 1841 and those for 1851, it was remarked in the report on the tables of deaths for 1851 that "three causes assist to elucidate this disparity. . . . First—we have reason to think the forms have been filled with greater care, and, therefore, a greater number of diseases have been named by the people in 1851 than in 1841, when for the first time inquiries of this nature were instituted. Secondly—of the 283,765 persons who died in workhouses, only 18,887 were registered in the records of these institutions, under some of the heads included within the term 'infirmity, debility, and old age,' because medical knowledge was at hand to name the specified cause of death in the other 205,972 instances; but had the entire 283,765 died at their own homes, it is more than probable, that had they been returned to us at all, a very much larger number would have been received under this heading. And, thirdly—from the circumstance so frequently referred to in this report, of the great social disturbances of the period, the returns are confessedly imperfect for the early years over which this inquiry extends."

To account for the decrease of 30,930 between 1851 and 1861, it is only necessary to add to the reasons just assigned, the diminution of the population, and the sources of our information having been so much reduced by an unparalleled emigration. The deaths from infirmity, debility, and old age, were in the proportion of 1 in every 8 of the total

deaths registered from all causes.

No. 89. Still-born—In Irish, Leanabh marbh, dead child; Togluasacht, abortion (old Still-born. There was not any return taken in 1841 of the number of still-born children; the Census returns for 1851 contained a record of 3,516, or 2,041 males and 1,475 females, and those for the recent decade a record of 3,259, or 1,935 males and 1,324 females, being in the proportion of 68.4 of the latter to 100 of the former. The hospital returns afforded 1,430 of these deaths, and those for workhouses 627; there were only 1,202 cases returned on the "Family Schedules"—a fact not surprising, as in an inquiry extending back ten years, still-born births in a family may have been forgotten, or the "head of the family" may have felt disinclined to afford the information.

The total number of deaths attributed to "Diseases of Uncertain Seat" in the Census Total Deaths returns for 1841 was 235,876; in those for 1851 it was 165,264, the sexes being in from Distribution of 92.7 females to 100 males; and in those for 1861 it was 134,069, eases of Uncertain the ratio of the sexes being 113.7 females to 100 males. The difference in the proportion Seat. of the sexes is chiefly attributable to the larger number of females than males who died in workhouses, the inmates thereof during the recent decade comprising, as might have been expected from the altered state of the country, a much larger proportion of females than during the pestilential period included in the former decade. According to the Census returns for 1841, deaths from diseases of uncertain seat were in the proportion of 1 in every 5 of the total deaths registered from all causes; by those for 1851 they were 1 in 82; and by those for 1861, 1 in every 6.1. In proportion to the population in 1861, deaths from diseases of uncertain seat (during the recent decade) were, according to provinces, as follows:—Leinster, 1 in every 35.1; Munster, 1 in every 49.5; Ulster, 1 in every 40.2; and Connaught, 1 in every 63.8.

Violent or Sudden Deaths.

The Report upon Coroners' Inquests, Section V., may, to a certain extent, be considered as the analysis of this class of deaths.

Report of Tables of Deaths.

Wounds.

No. 90. Wounds; in Irish, Lot, or Cneadh (see ulcer), applied equally to fresh wounds as to sores. Deaths from this cause were included in the Tables for 1841 and 1851; with the preceding class of diseases defined as of "uncertain seat," but on the present occasion it has been thought more correct to tabulate them with violent or sudden deaths, since the cause of death must have been violent, although the death itself may not have occurred for some time subsequent to the injury having been received. The number of deaths caused by wounds, during the decade ending in 1841, was 195; in that ending in 1851, it was 721; and for that ending in 1861, as many as 1,146 were returned—928 males and 218 females, being in the proportion of 23.5 of the latter to 100 of the former, a proportion remarkably similar to that shown in the returns for the previous decade—viz., 23.7 females to 100 males. Of the deaths from wounds returned in 1861, 689 occurred at the homes of the deceased—viz., 132 in the civic districts, and 557 in the rural; 314 occurred in hospitals, and 143 in workhouses. Deaths attributed to this cause have been returned at all ages, but the period of life under which most have been tabulated is that from 15 to 20. The more frequent use of the knife in drunken brawls or passionate disputes of late years, has largely increased the mortality from this cause.

Burns and Scalds.

No. 91. Burns and Scalds—Ambustio; in Irish, Doigh, or Scoladh, a burn or scald. The number of deaths registered under this head on the Census forms for 1841, amounted to 4,349; on those for 1851 to 6,990; and on those for the past decade to 5,928, or 2,867 males and 3,061 females, being in the proportion of 93.7 of the former to 100 of the latter. The deaths of females from these causes according to the Census returns for 1841 and 1851 were also in excess of the deaths of males, and the reason thereof was thus explained—" not only by the greater liability of females to the effects of fire or boiling fluids, and the greater combustibility of their dress, but to the increased mortality of that sex, owing to the constitutional shock being far greater in women than in men." the deaths returned in 1861, 907 were returned on "Family Schedules," received from the civic districts, and 4,075 on those from the rural; 635 deaths from burns or scalds were returned on hospital forms, and 311 on those for workhouses. As might have been expected, the majority of the deaths from burns and scalds were of children; 4,773 were under 10 years of age, of this number 3,477 were not 5 years of age, and 238 were infants under 12 months old. Deaths from these causes were registered at all ages, but after 10 years old the numbers were comparatively trifling. The deaths of children under 10 years old from burns or scalds bore the proportion of 1 in every 58 of the total deaths of children of that age. Coroners' inquests were held on 2,046 of these cases.

Drowned.

No. 92. Drowned—Submersio; in Irish, Badhadh, drowning. The Census returns for 1841 contained a record of 7,072 deaths from drowning; those for 1851 of 5,882; and those for 1861 of 4,568, or 3,514 males and 1,054 females, being in the proportion of 30 of the latter to 100 of the former—the proportion in the returns for 1851 being 31.6 females to 100 males; a disparity to have been expected from the greater liability of the male sex to this casualty. Only 22 cases of deaths from drowning were returned on the hospital forms, and those were probably of persons who had been taken to public institutions when life was extinct; 5 inmates of workhouses were drowned during the decade, and the remaining number of cases, amounting to 4,541, were returned on the "Family Schedules"—viz., 1,303 from the civic districts and 3,238 from the rural. The largest annual number of deaths from drowning during the decade occurred in the years 1856 and 1859, and the age-period at which most deaths from this cause occurred, was from 15 to 30.

Deaths from drowning during the decade ending in 1841, were in the proportion of 1 in every 1,156 of the population existing at the end of that period; in that ending in 1851, one in every 1,114; and in that ending in 1861, one in every 1,269.

Injuries of the Head.

No. 93. Injuries of the Head; in Irish, Briseadh an chloiginn, breaking of the skull. Deaths ascribed to this cause in the Census returns for 1841 amounted to 358; in those for 1851 to 438; and in those for 1861 to 569, or 468 males and 101 females. Of these 569 deaths, 169 took place at the homes of the deceased, 329 in hospitals, and 71 in workhouses. According to provinces, 224 of these deaths were returned from Leinster, 187 from Munster, 106 from Ulster, and 52 from Connaught.

Intem-

No. 94. INTEMPERANCE—Alcoholismus; in Irish, Meisge, a mixing or confusion of the brain. Deaths from intemperance amounted, during the decade ending in 1841, to 1,239, and decreased during the succeeding ten-year period ending in 1851 to 820—a result attributable to the "temperance movement." A slight increase has, however, occurred between the latter period and that ending in 1861, when they amounted to 868, or 737 males and 131 females, being in the proportion of 17.8 of the latter to 100 of the former; the proportion of the sexes in 1841 was 18.8, and in 1851 it was 24.1 females to 100 males. The deaths from intemperance returned from the province of Leinster for the 30 years ending in 1861, amounted to 667, or 1 in every 7,652 of its inhabitants at the

time of making the inquiries; those returned from Munster amounted to 831, or 1 in Report on every 6,940; from Ulster there were returned 1,104, or 1 in every 5,718; and from Connaught 325, or I in every 10,283. Of the deaths from intemperance returned in 1861, 263 were returned from the civic districts, and 568 from the rural; 34 deaths from Intemthis cause were recorded on the hospital forms, and 3 on those for workhouses. The number perance. of these deaths returned for the years 1852, 1853, and 1854, respectively, exceeded that returned for any other year during the decade. In the majority of instances of death from intemperance, the ages of the parties were not specified. Coroners' inquests were held on 862 of these cases—viz., 718 where a verdict of death from "intoxication" was returned, and 144 where the verdict was death from "intoxication and exposure." In addition to the foregoing 868 deaths from actual intoxication, 187 occurred from delirium tremens, for which, see No. 25, page 28, of this Report.

No. 95. Homicide; in Irish, Dun mharbhadh, person-killing; Dunorgain; murder. As Homicide. in the Census for 1841 and 1851, under this term were registered "all those instances of death, which, whatever may be the moral or legal guilt attached to them, have been (unaccidentally) caused by the hand of man. Infanticide, murder, manslaughter, justifiable homicide, or persons killed by others in self-defence, are all summed here together in the general table of deaths, . . . as in a medico-statistical point of view they may be all classed together, no matter what their crimes or how committed." The number of deaths tabulated under this head in the Census tables for 1841 amounted to 3,508, in the proportion of 27.8 females to 100 males; in those for 1851 they decreased to 2,409, and were in the proportion of 48.5 females to 100 males; and during the decade on which we now report they have still further decreased to 1,522, and are in the proportion of 48.8 females to 100 males. Of the deaths from homicide returned in 1861, 427 occurred in the civic districts, and 1,088 in the rural; 7 deaths attributed to this cause were recorded on hospital forms. In the majority of instances the ages of the persons whose deaths have been tabulated under the heading of homicide were unspecified, as the ages were not given on the Coroners' inquests returns. Under this head have been included all those deaths (1,521) embraced by Class I. in Coroners' inquests as having been "caused by violence, neglect, evil intent,

or design," and which have already been reported on at pages 8, 9, and 10.

No. 96. Starvation or Cold; in Irish, Gorta, starvation. The number of deaths Starvation attributed to starvation in the Census returns for 1841 amounted to only 117; in the or Cold. following decennial period, during which occurred the famine and pestilences already adverted to, deaths from starvation rose to the enormous amount of 21,770, forming the ratio of 1 in 63 of the general mortality; during the ten years ending in 1861 the deaths attributed to this cause were 830, or 511 males and 319 females, being in the proportion of 62.4 of the latter to 100 of the former. Of these 830 deaths, 668 were returned on the "Family Schedules"—viz., 84 from the civic districts, and 584 from the rural; 46 deaths from starvation were returned on forms from hospitals, asylums, and sanitary institutions —viz., 11 on those for general hospitals, 3 on those for infirmaries, 22 on those for lunatic asylums, and 10 on those for prisons. With regard to the 22 deaths recorded under this heading in the returns from lunatic asylums, starvation was probably self-imposed, and the deaths might be considered suicidal although returned as from "starvation." As to the 24 deaths from this cause returned on the other hospital forms, as well as 116 returned from workhouses, the persons, in all probability, arrived at, or were brought to, these institutions in such a weakened and prostrate state as to induce the officers to attribute death to starvation.

Of the 830 deaths from starvation, 175 occurred in that portion of the year 1851 included with the recent decade, and 166 during the year 1852. Children under 5 years of age, to the number of 188, were returned as having died from starvation, of which number 77 were infants under 12 months old. Eighty-six of the deaths were of children 5 and under 10, and the age-periods at which most adults died from this cause were "50 and under 55," and "60 and under 65." Deaths from starvation were in the proportion of 1 in every 988 of the total deaths registered from all causes in 1861.

No. 97. EXECUTED; Irish, Crochadh, or Riaghadh, hanging. The number of persons Executed. executed in Ireland during the decade ending on the 6th of June, 1841, amounted to 197, or 188 males and 9 females; during that ending on the 30th March, 1851, the number was 97, the sexes being 91 males and 6 females; and during the following ten years the number was only 19-18 males and 1 female. The ratio which executions bear to the number of murders which have been committed in Ireland during the periods referred to, has been given at page 9. Of the 19 executions, 1 took place in that portion of the year 1851 included with the recent decade, 4 in the year 1852, 5 in 1853, 4 in 1854, 2 in 1856, and 3 in 1858. The deaths in gaols, as given in the tables, embrace those of persons The following tables show the ages and occupations of those persons as well as the localities where the executions took place:-

Report on Tables of Deaths.

Executions.

Table showing by Occupations the Ages and Sexes of the persons who were Executed between the 30th of March, 1851, and the 7th of April, 1861.

Poison Accidental.

No. 98. Poison, Accidental; in Irish, Neimh, poison.—The number of fatal accidental poisonings returned on the Census forms for 1841 was 139; on those for 1851 it was 233; and on those for the ten-year period ending on April 7th, 1861, it was 171, or 114 males and 57 females. Of this number, 142 were returned by the families of the deceased on "Forms A"; 19 of them occurred in hospital, whither the persons had probably been taken for treatment on discovery of the accident, and 10 occurred in workhouses. The returns for Leinster afforded 47 of these deaths, those for Munster 39, those for Ulster 69, and those for Connaught 16. Deaths of children under five years old (33) from this cause exceeded those tabulated in any other five-year period; 20 deaths occurred at "five and under ten."

Suicide.

No. 99. Suicide.—The number of deaths by suicide returned on the Census forms for 1841 amounted to 792, or 497 males and 295 females; on those for 1851 to 869, or 591 males and 278 females; and on those for 1861 to 762, or 548 males and 214 females. Of those suicides during the decade terminating in 1861 there were committed in the civic district 222, and in the rural 467; 63 of the persons died in hospital, having been conveyed thither before life was quite extinct, and 10 suicides were committed in workhouses.

REPORT ON TABLES OF

DRATHS.

The returns of coroners' inquests have supplied us with the information respecting suicidal deaths in the civic and rural districts, as, independent of those persons who had left the country, from whom information might have been received, those who remained in Ireland, and filled the "Family Returns" on the night of taking the Census, could scarcely Suicide. be expected, in the majority of instances, to record the deaths of their relatives as suicidal. As the returns of coroners' inquests did not specify ages, we are not afforded the means of analyzing the age at which suicidal possession most predominates, but so far as our returns show, the quinquennial age-period at which it is most prevalent is from "forty to forty-five."

Taking the aggregate of the returns for the three decades, the number of suicides committed in the province of Leinster was 761, or a decennial average of 1 in every 6,707 of its inhabitants at the close of each decade; Ulster 794, or 1 in every 7,950; Munster 572, or 1 in every 10,083; and Connaught 296, or 1 in every 11,291;—so that poverty and

ignorance does not seem to have influenced suicidal propensions. No. 100. LIGHTNING; in Irish, Marbadh-le-Toirnig, killed by thunder; Marbadh-le-Lightning. saighnen teintighe, killed by a fiery arrow. Deaths from lightning were not enumerated in the Census Tables for 1841; the number recorded on the Census forms for 1851 amounted to 41, or 30 males and 11 females; and on those for the recent decade to 63, or 46 males and 17 females; of these latter, 7 occurred in the civic districts and 55 in the rural, and the death of 1 female from lightning was recorded on an hospital return, but whether she was an inmate at the time, or had been brought thither subsequently to the injury being inflicted by the electric fluid was not mentioned on the return.

Eleven deaths from lightning occurred in Leinster, 10 in Munster, 28 in Ulster, and 14

in Connaught, and the years 1857 and 1859 were the most fatal.

No. 101. ACCIDENTAL, UNSPECIFIED; in Irish, Bas toirmeasgach, accidental death. The Accidental, number of deaths registered under this head in the Census tables for 1841 amounted to Unspecified. 27,032; in those for 1851 to 10,208, and in those for 1861 to 9,874, or 7,631 males and 2,243 females, being in the proportion of 29.4 of the latter to 100 of the former. To account for the great decrease between 1841 and 1851 it may be alleged as a cause, that probably many who fell victims to the famine and pestilence would, under ordinary circumstances, have come by their death through accidents such as are not specified in the tables; but to account for the small number afforded in 1861 in comparison with that returned in 1841 is somewhat difficult, particularly when we take into consideration the extended lines of railways, fatal accidents on which have been tabulated under this head. -See Report on Railway Accidents, p. 12.

The total number of violent or sudden deaths returned on the Census forms for 1841, Total violent amounted to 44,998; on those for 1851, to 50,478 (of which 21,770 were from starvation), and on those for 1861, to 26,320, or 18,405 males and 7,915 females, being in the proportion of 43 of the latter to 100 of the former.

According to the returns for 1841, violent or sudden deaths were in the proportion of 1 in every 26 of the total deaths from all causes; according to those for 1851, the proportion was 1 in every 27; and by those for 1861, it was 1 in every 31.

No. 102. Causes not specified.—The deaths returned on the Census forms for 1841, Causes not the causes of which were not specified, amounted to 89,720; on those for 1851, to 135,781; and on those for the decade ending 7th April, 1861, to 82,809, of which number 66,179 were returned on the "Family Schedules;" 993 occurred in hospitals, and 15,637 in workhouses; the causes of this defect in the workhouse returns will be found explained in the foot-notes annexed to the tables thereof. The proportion of deaths of which the cause was not specified in the returns for 1841, was 1 in every 13.2; in 1851, it was 1 in every 10; and in 1861, 1 in every 9.9.

specified.

The total number of deaths returned to the Census Commissioners in 1841, on the Total deaths several forms devised for the purpose of collecting information on that subject was 1,187,374, from all or 620,865 males and 566,509 females, being in the proportion of 91.24 of the latter to causes. 100 of the former, and in the ratio of 1 death in every 6.9 of the inhabitants of Ireland, in June, 1841; in 1851 the numbers returned were 721,947 males and 627,708 females, or in the proportion of 86.95 females to 100 males, with 11,396, sexes unspecified, making a total of 1,361,051, or in the ratio of 1 death in every 4.8 of the population existing in March, 1851; and in 1861 the total number returned was 819,768, or 420,465 males and 399,077 females (together with 226 persons, whose sex was not stated on the returns), being in the proportion of 94.9 females to 100 males, the total being in the ratio of 1 death in every 7:1 of the population at that date. Thus it will appear that upon each of the three inquiries the deaths of males were in excess of those of females, the proportion, as just

Report on Tables of DEATHS.

stated, being respectively as follows:—in 1841, 91.24 females; in 1851, 86.95; and in 1861, 94.9 to 100 males; the proportion of the sexes of the living at the end of the decade being in 1841, 103.4 females; in 1851, 105.4; and in 1861, 104.4 to 100 males.

Districts.

Districts.—In 1841 the number of deaths returned on the Family Schedules received from those towns having 2,000 inhabitants and upwards, which then as now were made to constitute the "civic district," was 234,173, being in the proportion of 1 in every 4.8 of the population thereof in existence at the close of the decade; in 1851 the number was 217,535, or 1 in every 5.6; and in 1861 it was 165,390, or 1 in every 6.7. of deaths recorded on the "Family Schedules" returned from the rural district in 1841 amounted to 911,619, or 1 in every 7.7 of the population thereof in 1841; according to the returns for 1851 the number of deaths afforded by the Family Schedules from that district was 772,819, or 1 in every 6.9; and in 1861 the returns of deaths recorded on the "Forms A" received from the total rural district amounted to 479,296, or 1 in every 9.8 of the inhabitants thereof in 1861.

Public . . .

The forms received from hospitals, lunatic asylums, and sanitary institutions afforded in Institutions. 1841 a return of 41,582 deaths; in 1851, 86,932; and in 1861, 26,333. The deaths of workhouse inmates during the decade ending in 1851 amounted to 283,765, and during that ending in 1861 to 148,749, being a decrease equal to 47.6 per cent.

Provinces.

The total number of deaths returned from the Province of Leinster on the Census forms for 1841 amounted to 323,695, or 1 in every  $6\cdot 1$  of its population at the end of the decade ; on those for 1851 to 355,310, or 1 in every 4.7; and those for 1861 to 248,056, or 1 in every The number of deaths returned from Munster in 1841 amounted to 363,907, or 1 in every 6.6 of its inhabitants at the time of taking the Census; in 1851 to 470,842, or 1 in every 3.9; and in 1861 to 235,675, or 1 in every 6.4. The deaths returned from Ulster on the Census forms for 1841 were 294,550, or 1 in every 8.1 of its population in 1841; in 1851 they were 310,640, or 1 in every 6.5; and in 1861, 234,553, or 1 in every 8.2. From Connaught, 205,222 in 1841, or 1 in every 6.9; 224,259 in 1851, or 1 in every 4.5; and 101,484 in 1861, or 1 in every 9 of its inhabitants at the close of the decade. II., on pages 214 to 217, shows, by ages, the number of deaths returned on the Census forms in 1861, also the names of the diseases of which the persons died; and Table III., pages 218-19, also shows the ages, together with the localities and years in which the deaths occurred.

Ages and Sexes.

Table showing, by Sexes, the Per-centage of Deaths at each Age-period, according to the Census Returns for 1851 and 1861; and the proportion of the Living at the same Age-periods.

The foregoing Abstract shows by Provinces and for the total of Ireland, the proportion per cent. of deaths, at certain age-periods, returned for the decades ending in 1851, and 1861, respectively, and the proportionate number of the sexes; also the proportion per. cent. of the living in 1851 and 1861, at these age-periods, and the proportionate number, Ages and of the sexes.

REPORT OF DEATHS.

Sexes.

From that tabular abstract may be taken the following analysis:

Infants under 12 months old.—The deaths returned at this age in 1851 were in the proportion of 10.9 per cent. of the total deaths at all ages; in 1861 the proportion was 13.2, varying in the provinces from 12.3 in Ulster to 15.5 in Connaught. The number of the living at this age, at the time of taking the Census in 1851, was 2.0 per cent., and in 1861 it was 2.4. According to the returns of deaths, the proportion of the sexes in 1851 was 83.2 females to 100 males, and in 1861 it was 80.9. The proportionate number of the sexes of the living under 12 months was remarkably similar in 1851 and 1861, the number of females to 100 males in the former year being 96.6 and in the latter 96.5.

Persons 1 year and under 5.—Deaths at this age were, according to the returns received in 1851, in the proportion of 180 per cent, of the total deaths at all ages; in 1861 the proportion was 14.4, the ratio of the sexes being very similar, viz., 95.8 females to 100. males for the former, and 95.3 for the latter period—a proximity borne out by the proportionate numbers of the sexes of the living at the same age-period, namely, 96.9 females to 100 males in 1851, and 97.1 in 1861. The number of persons 1 year old and under 5 in Ireland at the time of taking the Census in 1851 bore the proportion of 7.8 per cent. of the total inhabitants, and in 1861 the proportion was 9.6.

Persons 5 years and under 10.—The number of deaths returned at this age on the Census forms for 1851 was in the proportion of 9.7 per cent. of the total deaths at all ages; in 1861 the proportion was only 6.4. The proportionate number of the living at this age-period fell from 12:3 per cent. in 1851 to 10:5 in 1861. According to the death returns at this age the proportionate number of the sexes was, in 1851, 96.8 females to 100 males, and in 1861 it was 96.3. The proportion of sexes amongst the living was

very approximate—viz., 97.0 females to 100 males in 1851, and 97.4 in 1861.

Persons 10 years and under 20.—According to the Census returns for 1851, the deaths at this decennial age-period amounted to 10.9 per cent. of the total, and by those for 1861 they amounted to 9.5, the proportion of the sexes being for the former occasion 97.8 females to 100 males, and for the latter 101.4. In 1851, persons of this age formed 26.2 per cent. of the total inhabitants, in 1861 the per-centage was 21.9; the proportion of the sexes being 99:0 females to 100 males for the former period, and 99:9 for the latter.

Persons 20 years and under 30.—The number of deaths returned at this age-period on the Census forms for 1851 was in the proportion of 8.0 per cent. of the total, and on those for 1861 the proportion was 8.6. The proportion per cent. of the living at this period of life in 1851 was 16.2, and in 1861 it was 17.7. According to the death returns, the proportion of the sexes was 81.6 females to 100 males in 1851, and in 1861 it was 84.5; and by those for the living, 108.8 females to 100 males in 1851, and 105.9 in 1861.

Persons 30 years and under 40.—The deaths returned at this age in 1851 were in the proportion of 6.2 per cent. of the total deaths, and in 1861 the proportion was 6.3; the proportionate number of the female sex which was, in the former period, 98.2 to 100 males, increased in the latter to 107.2, whereas the proportionate number of the living of the same sex decreased from 113.8 to 100 males in 1851, to 109.1 in 1861; the proportion per cent. of the living to the total inhabitants of all ages being 11.2 in the former year, and 10.3 in the latter.

Persons 40 years and under 50.—The returns for 1851 afforded a number of deaths at, this age-period equal to 7.5 per cent. of the total, and those for 1861, 7.2 per cent., the proportion of the sexes being in 1851 only 82.5 females to 100 males, and in 1861, 96;9. The proportion per cent. of the living at this age-period in 1851 was 9.7, and in 1861, it, was 10.0, the proportion of the sexes being in the former year 112.9 females to 100 males, and in the latter 114.5.

Persons 50 years and under 60.—According to the returns for 1851, deaths at this age amounted to 8.4 per cent. of the total number returned, and according to those for 1861. they amounted to 8.5, the proportion of the sexes being 69.5 females to 100 males in the former, and 88.8 in the latter. The proportion per cent. of persons in Ireland in 1851, aged 50 and under 60 was 7.4, and in 1861 it was 8.3, the proportion of the sexes in the former year being 111.3, and in the latter 106.3 females to 100 males.

Persons 60 years and under 80.—The number of deaths at this age returned on the Congress forms for 1851 amounted to 16.0 per cent of the total and are those for 1861 to

Census forms for 1851 amounted to 16.0 per cent. of the total, and on those for 1861 to, 19.9 per cent.; the proportion of the sexes was 76.3 females to 100 males in the former, and 101.9 in the latter, the proportionate number of females to 100 males decreasing from; 120 in 1851 to 112.3 in 1861. The number of persons in Ireland in 1851 aged 60 and under 80 was 6.5 per cent. of the total number of inhabitants, and in 1861 it was 8.4.

REPORT ON TABLES OF DRATHS.

Ages and Sexes. Persons aged 80 years and upwards.—The number of octogenarians returned in 1851 as having died during the decade then terminated amounted to 4.4 per cent. of the total number of deaths, and in 1861 the number amounted to 6 per cent., the proportion of the sexes being on the former occasion 95.5, and on the latter 108.6 females to 100 males; the proportionate number of the living being 145 of the former to 100 of the latter in 1851, and 134 in 1861. At the time of taking the Census in 1851, "persons 80 years old and upwards" bore the proportion of 0.7 per cent. of the total number then living in Ireland—in 1861 the proportion was 0.9 per cent.

Thus it will be observed that the decennial age-period at which fewest people die in Ireland is from 30 to 40; the next least fatal age-period being the ten years following, i.e., 40 to 50. The per-centage, in 1861, in the quinquennial period from 5 to 10 (6.4), must be considered under the average, that given for 1851 being in all probability very approximate to the truth, the lower rate of mortality amongst children aged from 5 to 10 years, during the decade ending in 1861 being ascribable to the diminution of marriages during the latter portion of the decade ending in 1851. The ages returned in the Death Tables for the ten years ending in 1861, show that a greater number of persons had lived to an older age during that decade than during the previous one, the per-centage of persons who had died before attaining their thirtieth year during the decade ending in 1851 being 57.5, and during that ending in 1861 only 52.1.

in 1851 being 57.5, and during that ending in 1861 only 52.1.

The per-centage of deaths at "60 and under 80" increased 3.9 per cent. between the two

periods, and the deaths of those "80 years old and upwards" increased 1.6.

According to the returns for 1851, the deaths of males were more numerous at every age-period than those of females, the largest disproportion being in the period "50 years old and under 60," for which there were only 69.5 deaths of females returned to every 100 deaths of males; in 1861, however, the female deaths outnumbered those of males at the following age-periods, viz., "10 and under 20," "30 and under 40," "60 and under 80," and "80 and upwards." It is highly probable that the proportion of female deaths at the greater age-periods exceeds that of males, and the paradox of the returns for 1851 may be attributed to the greater number of males who fell victims to the famine and pestilences which occurred during the period over which those returns extended. It will also be perceived, from the abstract on page 50, that after 20 years old the number of females amongst the living exceeded the number of males at the time of the Census inquiry, both in 1851 and 1861.

SPECIAL
SANITABY
REPORT ON
DUBLIN
CITY.

SECTION VII.—SPECIAL SANITARY REPORT UPON THE CITY OF DUBLIN.

In the Census publications both for 1841 and 1851 a special report was given on the deaths which had been returned as having occurred within the municipal boundary of Dublin City during the ten years antecedent to each of the inquiries. For the latter period, Tables were added showing the number of burials which had taken place in the several grave-yards within the city, and in those situated in the immediate vicinity thereof, during the decade. Upon the present occasion similar information has been sought, and the results will be found tabulated in the following pages.

Division into Localities.

For the sake of comparison, in a sanitary point of view, the city (both north and south sides) was divided upon each occasion in the following manner:—

No. 1. First-class Private Streets—which included all the squares, principal private streets, and residences of the upper classes of society, and which were unoccupied by shops, and not places of public business,—but exclusive of the lanes, mews, passages, or minor streets thereunto adjoining. As, however, a large city like Dublin, extending its boundaries yearly, usually increases for a given time in a certain direction, alterations must occur in the number and character of its streets from decade to decade; and for a great number of years past the character of the streets upon the north side of the city, compared with the south, has altered considerably; and, therefore, the number of first-class localities have decreased on the north, whilst upon the south side they have increased

No 2. Second-class Private Streets—are likewise inhabited by the upper ranks of society; but they are generally of an inferior description, both as respects locality and houses; many of them are also situated in less healthy situations than the first-class, and some of them contain shops intermixed.

No. 3. First-class Shop Streets—among which will be found, in some instances, private residences, as in Sackville street, &c.

No. 4. Second-class Shop Streets—are inferior to the former, but generally in the vicinity, and often connected therewith.

No. 5. Third-class Shop Streets—are of a still lower character, and are generally inhabited by the lowest class of traders, huxters, &c., and are also the residences of artisans. No. 6. Mixed Streets—include small shops and the private residences of the middling classes.

Districts.—It is stated in the report for 1841:—"As, however, a large proportion of the working classes and the very poorest portion of the community inhabit the small streets, lanes, and alleys which fill up the spaces between all these specified localities, and as several portions of the liberties of the city, although composed of large and open streets, are also inhabited by similar classes, it became necessary to include them in the returns under some general head, and the simplest division that offered was that of the present [1841] municipal arrangement of Dublin into wards. Each district, therefore, includes all those parts not specified in the foregoing classification within the boundary of the ward."
